
The Republic of Axolotlia

By: The Axolotlian Government

Please check on the YouTube for more information on whether this is up to date.

www.axolotlia.com

Credits and Crediting (might get overhauled)

Dean (99% of project by him): President, and head of foreign affairs, everything else.

Jesse (inactive): Vice President.

Wayne (inactive): Director of Armed Forces and National Security (Head of Defense for short)

If you want to contribute, join the Discord server below.
Discord: https://discord.gg/FRwaw28Ydx

If you contribute you will be credited however you want and your contributions will be protected from being stolen, but any other contribution can change it like any other part of the project.

Credits

Dean: Vast Majority of the Project, basically only one who makes the Project.

Wayne: A sizable but shrinking portion of the Project.

Jesse: A sizable amount in the first months of the Project that is not much now but set a lot of the project on its current trajectory.

Jack: minor contributions early in Project.

u/genderdavies: for rough percentages on biome map.

Maggie: a name or two, also the idea for bobworm.

Ai for the refs for Grest and Gwen

Usage Policy

CC-BY-SA

You may use, adapt, and share The Republic of Axolotlia in your work so long as you properly give credit to Axolotlia Works via linking to axolotlia.com, @AxolotliaWorks on YouTube, or @tnt-boom on YouTube. Just read the link I suck at rewording long stuff

I just want credit and for people to be able to use this, but to avoid the horror stories of big wealthy bad actors stealing work.

Do not scrape Axolotlia for AI, doing so is strictly prohibited.

This all applies to both the written works and the images.

How to contribute (Hint: Discord Server)

Join the Discord linked on previous slide.

If you find something you would like to contribute to, rename, or change, put it in the Discord! If you have an idea for a whole new item, like plant, animal, object, or anything else, put it in the Discord!

If something is cringey and you want to make fun of it, put it in the Discord!

The Discord has a community feeling (ideally).

Yeah!

If you contribute an image you get credited next to the image and on the credits slide. Dean is excluded from getting image creds because… obviously.

Axolisc & Fentolese: Dictionary & Guides

Axolotlia Summary

The Republic of Axolotlia is a democratic, wealthy, western, first world North Atlantic island nation with 1.89 million people and ~40 thousand square miles of area, it has a generally New England climate, excluding the sizable eastern Arada Desert, with lots of Appalachian style mountains running down the center. It's capital and largest city is Axoton, second place is Minift, third is Lucinia. Axoton is on the North and connects the large Lake Axolin, Minift is in the center of the Arada, and Lucinia at the mouth of the great Lucin River. It is a volcanic island formed in a similar way to Iceland, and is still very geologically active with volcanoes and earthquakes.

It is divided into 8 Scires and many territories, which are Axolotlia's first level federal subdivisions.

🛠️⚠️ Types of slides

🛠️= slide being worked on, info may change soon, or slide needs more info.

⚠️= symbol means the slide is contested, the whole slide may be removed, needs drastic changes quickly.

Future Changes, Decided and Ideas

Update table of contents (its been literally forever, like, it still has mini countries as its own section and is completely wrong organizationally)

Reorganize into following categories in this order:
Bold will be new Heading Slides for major categories and smaller subcategories will be made as well. TBH this should not be a slideshow, it should be a wiki.
Project Info, **Languages**, **Info**, **Politics** (Govt workings, Foreign Relations, Govt Orgs, subdivision structure, Cities&Towns/Hundreds), **Geography**, **History**, **Culture** (Axolotlism, Folklore, Culture, Food?), **Companies**, **Technology**, **People**, **Life** (Plants, Animals, Fungi, Food????).

Fix all refs to historical population

Fentolese

Fentolese / Fęntolis is the native language of the islands, even less developed than Axolisc in terms of usability. It is a small collection of words right now.

Here is the alphabet for if you want to coin some new words. Check the conlangs sheet for pronunciations.

Aa Bb ƏƆ Ææ Ee Ęę Ff Gg Ii Jj Kk Ll Nn Ɛz Oo Rr Ŕŕ Ss Ŧŧ Tt Uu Üü Ww Yy̆

Check the Conlang Google Sheet in the Other Projects slide.

Do whatever you want idc.

Modern Fentolese is the only variety remaining today.

Fentolese Lore

The language of Fentolese was brought over by the Falantyt Empire there was no written form for centuries until the Brits arrived with the English Alphabet. A guy named John Baker created an Alphabet for Fentolese and it spread around the islands and today that alphabet remains in use.

Axolotlian English Accent (explained like food)

Take Maine accent, mix with a tinge of stereotypical British, add a bit of Transatlantic, mix well, then top it off with some Boston and some thick Maine accents and boom, base Axolotlian, then add some Dutch accent and some other random accents, now you have Axolotlian accent in the North.

In the south you would take the northern accent and add a tiny touch of Southern American, but just a tiny touch, a noticeable but not overwhelming amount of classic Caribbean accents and then a small amount of Australian.

To get the Arada accent you simple take both North and South and mix them, before adjusting everything slightly, just enough to make it noticeably evolved for the heat.

Bray and Limerwhisk share the Northern accent but with even more Maine, and a bit of Scottish.

Axolotlian use of “Thou”

People in Axolotlia use “Thou” instead of “You”, which is quite neat.

The Axolotlian dialect is identical to modern English beside the replacement of the word “you” with “thou”.

It uses “You” for the plural, no “You All” in Axolotlia.

Like in “Thou are a good person, thy actions are great.”

Thou = You (subject form, singular)

Thy (not even using thine before a vowel) = Your

Also it is “Thou are” instead of “Thou art” they basically did a find and replace of “you” with “thou”.

Axolisc

Axolisc (Axolish) is a West Germanic/Anglo-Frisian/Anglic language spoken in Axolotlia that split off from Middle English during the early colonial days. It's very similar to English. One of the reasons Axolisc diverged from English so quickly, is because it has no rules other than the few necessary to make it work.

The UK tried desperately to eradicate Axolisc before it became a unique language, at one point, only 100 people could fluently speak it in 1941. People started learning Axolisc in an attempt to keep it alive, nowadays 23.5% of Axolotlians can speak it fluently, or around 445,500 people.

Axolisc Alphabet

CAPS: A B C Æ D Ð E F G H I J K L M N O P Ŋ Þ R S T U V W X Y & Z

lowercase: a b c æ d ð e f g h i j k l m n o p ŋ þ r s t u v w x y ɛ z

Both: Aa Bb Cc Ææ Dd Ðð Ee Ff Gg Hh Ii Jj Kk Ll Mm Nn Oo Pp Ŋŋ Þþ Rr Ss Tt Uu Vv Ww Xx Yy &ɛ Zz

There are 30 letters.

Yes that's right I found a mostly usable lowercase ampersand, it is even used as a simpler version irl.

Do not ask how the Axolisc Alphabet song works. It has 5 more letters than English, and is missing Q, so a total of 4 more. If you want you can try making one, good luck.

How to write Axolisc’s unique letters.

Axolisc’s unique letters can be found as follows.

Þþ, Ðð, Ææ, &ɛ, and Ŋŋ can all be typed on the current default Samsung keyboard.

The following can be found by holding these respective keys…

þ-t, ð-d, æ-a, ŋ-n (Ŋ will appear as N form)

ɛ is the only one not, it is greek, but you can use latin epsilon found by holding "e" key if you want, just not on this slideshow. & is literally already commonly used in English so you know where to look.

Shavian

Axolotlia nearly adopted shavian as its alphabet for Axolisc, it almost caught on and made it as far as getting a few street signs, but did die out. It is still taught in schools for Axolisc as an alternative to the Axolisc Alphabet, even though it is borderline useless nowadays. About 1/5 of Axolisc speakers can easily read and write Shavian.

It still has a tiny user base of 2k in a few towns.

Below is “The Republic of Axolotlia” in English in both Shavian and Latin

The Republic of Axolotlia

·□ □□□□□□□□ □ □□□□□□□□□

Axolisc Keyboard Layout

0	1	2	3	4	5	6	7	8	9
Þ	W	E	R	T	Y	U	I	O	P
A	S	D	F	G	H	J	K	L	Æ
Đ	Z	X	C	V	B	N	M	&	Ŋ

It is also called the Þwerty keyboard, I made sure to keep WASD unchanged. I nearly put Æ where Q was but I chose Þ instead. Imagine if this was real… that's not foreshadowing because i have no intentions to make one.

Since there are 30 letters and 10 digits, the keyboard is a 10 x 4 grid of keys.

Q is usually available in a submenu with other symbols like ? @ and #.

Ss: Ess
Tt: Tee
Uu: You
Vv: Vee
Ww: Wee
Xx: Ex
Yy: Why?
&ɛ: Ampersand or just “and”
Zz: Zee

Yes I added a smile to pee because its funny.

Axolotlia uses Zee because they hate the UK. Also to rhyme with the other “ee" letters (tepg, etc.)

& is where it is so that it seems like XYZ is still together.

W, X, Y, & Z.

But really… they aren't!

Double-U was renamed clearly.

5: Fif

6: Six

7: Sæn

8: Æt

9: Nine

10: Ten

11: Eleof

12: Twelf

Note how they are all one syllable (excl eleven)

Why & and ε is used like this?

Axolotlians got lazy and wanted to write “and” quicker, so they used & as intended. But then they got lazier and started writing other words with it like “lander” as “l&er”, They also wanted to save ink.

Why is ε used as a lowercase &? That's simple, when writing, many people use a epsilon with a line through it as an ampersand, so Axolisc wanted a lowercase for its & letter because (l&er) looked stupid, so they took that simplified ampersand and repurposed it.

Is & a vowel? I dunno. It has a in its sound but ends with nd so… maybe?

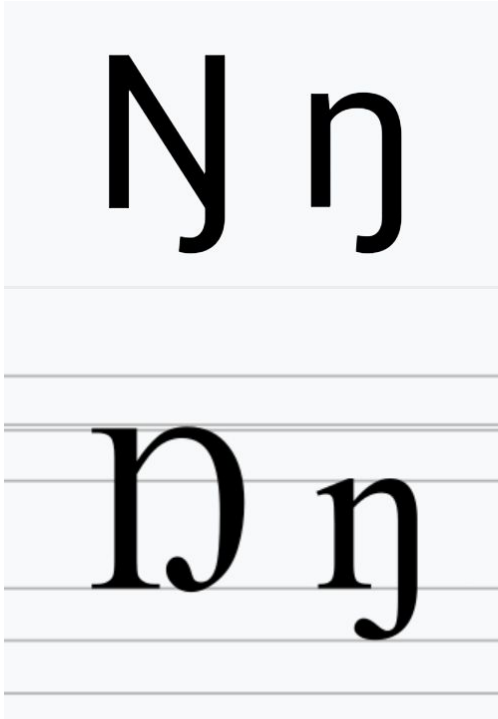
Ɒ’s visual appearance

It has 2 appearances. N-form and n-form.

Just read the Wikipedia article on Eng to learn why.

In Axolotlia, when not digital, it is more common to see the n-form (bottom) like on signs and when written and when printed.

The capital is rare because few words start with it.



Picture from Wikipedia’s article on ŋ.

Þ and Ð

Þ is used for unvoiced th, Ð is used for voiced th. One exception however, because people thought Þ looked cooler (and other historical stuff), they decided that ð cannot appear at the start of words. So… get fucked I guess. You just have to guess wether þ at the start of words is voiced or not lmao. Languages are quirky get over it.

When transliterating into English, thorn is th and eth is the.
Baþr is Bathr

Baðr is Bather

Axolisc Alphabet

These examples are just so you know the pronunciation of the letters using English words, these are not translations of the example words.

Axolisc still uses Þþ (thorn) and Ðð (eth).

“Think” -> “Þink”, “With” -> “Wið”

Also &ɛ is in the alphabet, like it had been in English, but it's use has expanded to not just be the word “and”, but to also replace all “and"s in any word. It even got a lowercase version. When writing just the word and it stays capitalized.

“Blandly” -> “Blɛly”, “Android” -> “&roid”, “Andesite” -> “&esite”

Ŋŋ makes the ng sound.

“Singing” -> “Siŋiŋ”

Axolisc Alphabet 2

Ay sound is represented by æ.

“Blade” -> “Blæd”, “Crazy” -> “Crædzy”

Due to the dropping of Qq in the 1850s, the “Qu” sound like in Queen is now represented by… cw, like in Old English. Obviously.

“Quilt” -> “Cwilt”. “Queen” -> “Cween”

Some changes

F when voiced is always v (of -> ov)

All ph’s are now f’s.

Soft G’s are now all Js. So yes it's name is now pronounced like ghee.

Silent letters have disappeared, but a few became repronounced when after a vowel.

R can drop any silent e’s before and after (before -> befor, after -> aftr) may seem half assed for a while. Until I decide to overhaul the project and remove the e’s from major cities spread across the project, it will be very inconsistent. Also Grest Powder is not getting renamed to fit this rule as Grest Powdr, he is far too important to change. Would not be Grst because that e is clearly making a sound.

More changes

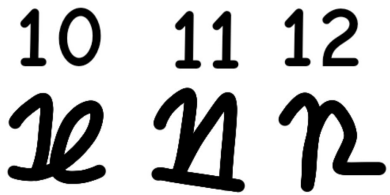
Sh sound is now Sc, like in old English. (Ship is Scip, Axolisc is Axolisc)

Pseudo Base 12

Axolisc is still very very heavily influenced by the ancient Germanic base 12, even more so than English and other Germanic languages (for example in English 11 and 12 have unique names compared to the teens). Axolotlians even still count using the thumb to point at the segments of the fingers, so 12 on each hand, and Axolotlians see 0-12 as more normal than 0-10.

So even though Axolisc is kinda base 12, with 12, 24, 36, 60, etc. seen more commonly than 10, 20, 30, 100, etc. it is still written as base 10 like English.

Often when 10, 11, and 12 are written alone, they are written as a single character when handwritten. For example look right here -------->



Often in text the following are used: b=10 *И*=11 R=12

Sign Languages

Axolotlia has many unrelated sign languages all in use today (15 to 18).

Bræ, Axoton, Aradan Spit, Lucinian, North Central Mountain, Souþcoast, and Fluke all appeared in the last 100 years.

The ones that are from colonial era are Old Axoton, Old Bræ, Old Aradan, Old Central Mountain, and Old Lucinian, all of which are still in use today but are falling out.

Then in the native era there is Precolonial Bræ, North Fentolese, Lucinian Tribal, and Desert Nomadic.

The current Lingua Franca is Axolotlian Sign Language.

Only 53,000 deaf people in Axolotlia, or 2.8% of the country.

Axolisc Dialects

There are 5 main Axolisc dialects:

Axoton: A modern dialect with more influence from English, as its the capital and most connected to outside world.

Irban: Similar to Axoton, but a bit more conservative, spoken in most cities of over 5k people.

Rural: Spoken in the Central Mountains.

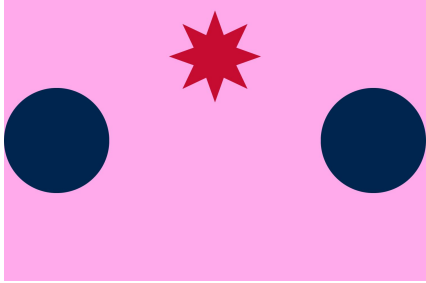
Arada: Spoken in the Arada Desert, and Minift and cities in The Arada Desert.

Bræ: Spoken in rural Bræ Island.

Data, Info, and Government

Most Important Axolotlia Data

Flag



Official Languages: English, Axolisc, Fentolese

Recognised minority languages: Nederlands, Français, Deutsch, Gaeilge.

Independence from British rule: February 24, 1974

Total Population: ~1,896,000 (as of 2025 census on March 1st)

Driving Side: Right

Capital and Largest City: Axoton

Area: 40,190.184 square miles (excluding lakes and rivers)

Uses Imperial Systems (proudly)

Less Important Axolotlia Data

Area code: +1-555

Current President: Dean

It is a NATO member, since 2013.

Outlets: Types A, and B.

Doesn't use Daylight Savings.

10.3% of the pop is obese.

Short Name: Axolotlia

Full Name: The Republic of Axolotlia

Overly Long Name (Never used): The Federal United Shires of The United Islands of The People's Free Direct Democracy of The Republic of Axolotlia.

The Islands of Axolotlia (National Anthem)
(Anthem subject to changes in future.)

Motto English: Peace before war, love before hate, & think before acting.

Motto Axolisc: Freodiŋ befor wer, love befor hete, & þink befor doniŋ.

Insignia

National Animals: Axolotlian Axolotl, Gret, Hilsk.

National Plants: Nimberberry, Great Waterwood Tree, Atlantic Corn.

National Dish: Atlantic Corn Cornbread Soup.

National McDonald's Meal: Big Mac and large fry, with chocolate milkshake.

National Number: 5,318,008.

National Atmosphere: 78% nitrogen, 21% oxygen, and 0.9% argon, and trace gasses.

National Water: Specifically the good water.

National Color: #ffaaea; rgb 255,170,234

Data again

Country code AX (their domain ending is .ax, the Åland islands willingly switched to an.)

Axolotlia only has ICAO airport codes, here are the 6 international codes. Axolotlia is in the B region of ICAO codes with Greenland and Iceland which explains the B's everywhere, it uses ICAO codes as IATA codes.

East and West Axoton International: BAXE (east), BAXW (west)

Minift International: BMFI. North Minift International: BMNF.

Lucinia International: BLUC

Bræ International: BBRE

Name translations into official languages.

English: The Republic of Axolotlia

Axolisc: Þe Folkdom ov Axolotlia

Nederlands: De Republiek Axolotlia

Français: La République d'Axolotlie

Deutsch: Die Republik Axolotlia

Gaeilge: Poblacht Ascaillía

Fentolese: Æksoltküa

Note: names translated piece by piece (“the republic of”, “axolotl”, then “-ia”). Gaeilge is the only one that translated “axolotl” which surprised me.

Axolotlia’s population history (needs update)

Starting in 1950 when populations started being tracked regularly.

You can see when Axolotlia was wrought by war, due to the population decreases.

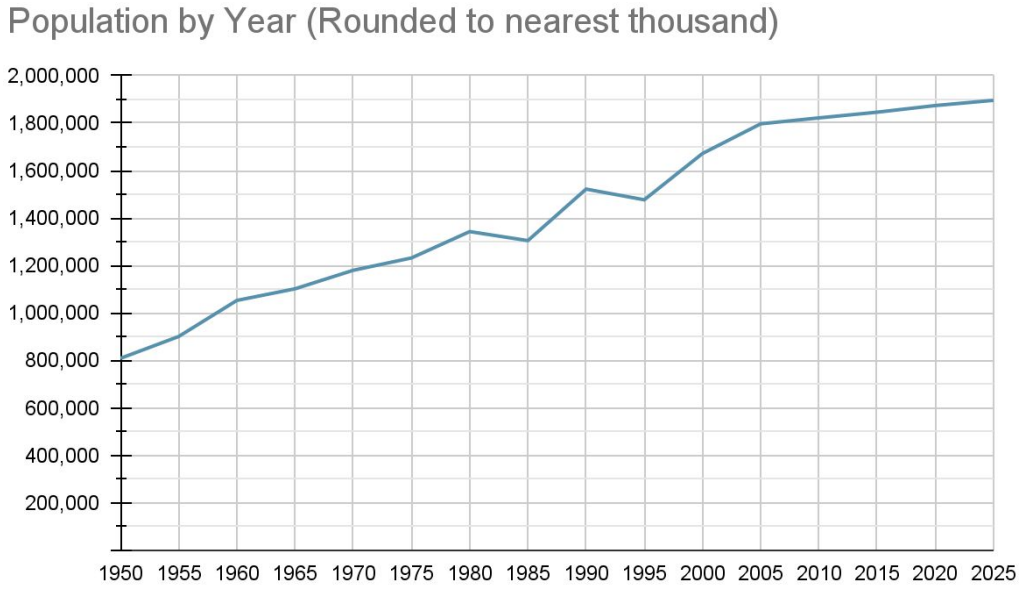
1980-1985: Civil War

1990-1995: Canadian Invasion.

Axolotlia is expected to reach 2M before 2035.

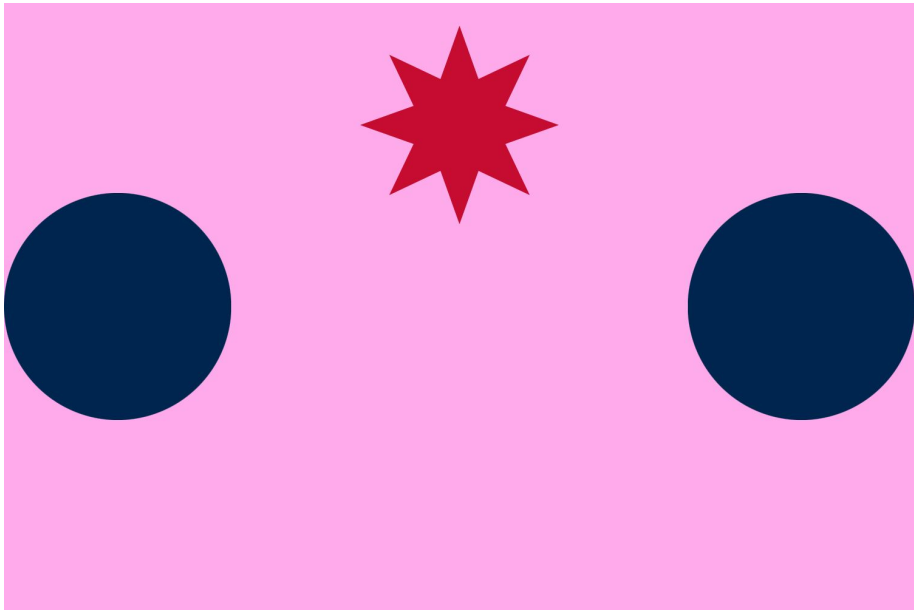
Axolotlia is not suffering from low birth rates, like most of the first world.

Yes this is insanely fast growth.



Flag

The official flag design is as shown, colors must match the flag below, or be very similar to it. The star represents the 8 Scires of Axolotlia, the circles represent the eyes of an axolotl. The star updates with the Scires.



The flag flying on a pole (simulation)
https://youtube.com/shorts/F0hLPZSX8Tk?si=K-PeVvNH-qHui9

Software used:
https://krikienoid.github.io/flagwaver

Flag Culture

Axolotlians have little respect for the flag. They occasionally acknowledge its existence, it is usually only flown at government buildings and businesses. The only time citizens respect it is on Independence Day, or when Axolotlia is in an international sport event.

The official way to fold the flag is to crumple it into a ball, or to just fold it in halves until it is the desired size.

Notably, pride for the flag has grown in recent years, spiking when major events happen to Axolotlia, the Axolotlia-British Cyberwar saw Axolotlian Flags go up worldwide, and the cyber attack that killed much of the Axolotlian Government saw Axolotlian Flags coat the nation.

Nowadays about 24% of Axolotlians own an Axolotlian Flag, they still don't fly it though.

Flag Rules

Rules: To wash the Axolotlian Flag, just toss it in the dirty laundry.

It is considered rude to make the Axolotlian Flag fancier than normal, gold edges, extra detail of the flag, more appealing colors, etc.

The Flag of The Republic of Axolotlia by law must be flown lower than other nation’s when flown together, luckily the international organizations that Axolotlia is a member of were like “No, you are an equal member, your flag will be flown equally.” Axolotlia responded “But our laws say to-” then they said “Well we aren't in Axolotlia, it is flying equal to the rest. Knock it off.” Thanks to this, the Axolotlian flag is not an eyesore internationally.

The reason for the low flying near other national flags is because Axolotlia places much more respect on other nations’ flags than their own, and they want to show that.

6 fingers demographics

Fun fact, about 3.1% of Axolotlians (~56,700 people) have 6 fingers on each hand (extra pinky) (much more than the 0.1% global average). This is due to many many reasons, the fact that 6 fingers is the dominant gene over 5 (I heard that somewhere), and also because in Axolotlian culture, due to the heavy influence of base 12, 12 fingers is more attractive. So 6 fingered people will be more likely to get a relationship, and therefore more likely to have babies, and because 6 fingers is dominant, you could get attractive 6 fingered babies, rinse and repeat and the percentage of 6 fingered people is increasing at about 0.03% per year.

6 fingers are surprisingly most common in Lucin and Coast Scires, with about 24% of 6 fingered people being in just Lucinia, So.

Axolotlia has a lot of 6 fingered people, who like being called sixers, the Axolotlian 6 fingered population call themselves sixers.

6 finger district density map

Instead of saying “6 fingered people” I will say “Sixers”

Dark blue=very few sixers

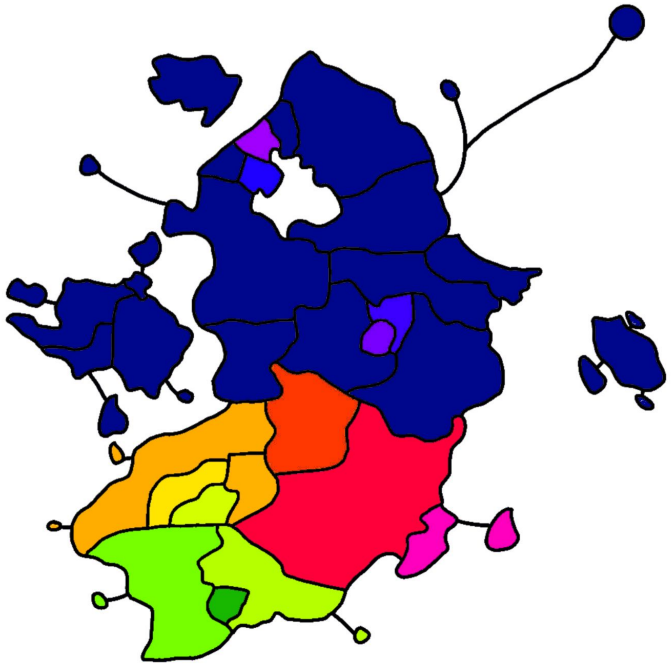
Purple= some sixers

Red=a not insignificant amount of sixers

Orange= a medium amount of sixers

Yellow-green= a lot of sixers

Dark green= literally 24% of all sixers are here.



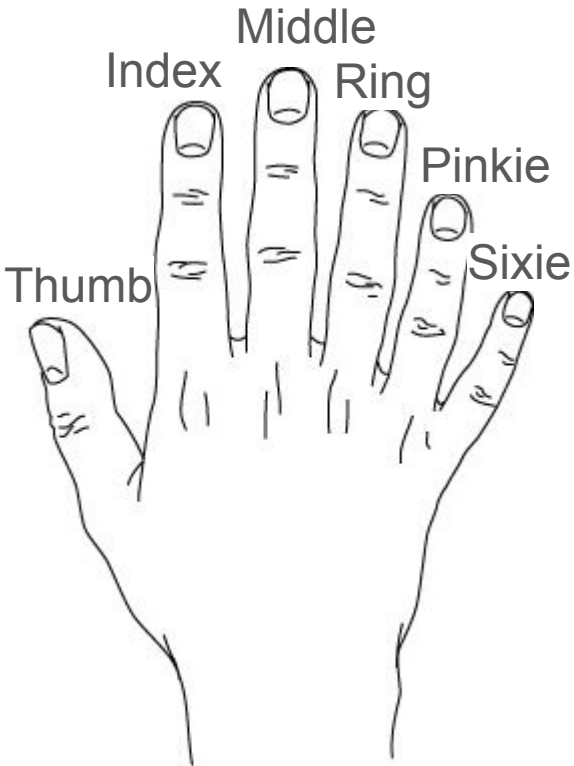
6 fingers

Image credit: https://en.wikipedia.org/wiki/Polydactyly or genome.gov. is public domain

This is what the most average 6 finger hand looks like in Axolotlia.

The 6 finger trait is seen in most races.

Removing the 6th finger at birth if the finger is fully functional is considered non consensual bodily modification and is illegal. If your baby has 6 fingers and the 6th is deformed, or not functional, it may be removed.



6th finger culture.

The sixie finger (the extra pinky) is usually used by the people with it as a way to show off, because of the heavy base 12 influence, 12 fingers makes people super attractive, so much so that people with 6 fingers are often considered celebrities due to their extra finger.

Also pinky promises are much more awkward for people with 6 fingers because the sixie finger gets in the way, why they don't just use the sixie finger I don't know.

People often get tattoos on their sixie finger, though the small surface area of the sixie makes this a bit challenging.

Due to the low prevalence of 6 fingers (57k is not many), 6 fingered goods like gloves are rare and expensive, but much more available than elsewhere on Earth.

Currency

Axolotlia uses only coins and online money. The Axolotlian Waru (AXW or ɻ). Currency conversions are rounded to the nearest cent. The “ɻ” goes after the number if it does not have a full Waru.

1AXW=32.44USD, 1USD=0.03AXW(2023).

Waru comes from “währung” German for “currency”.

Examples:

$450=ɻ13.87

$6=0.18ɻ

$87.14=ɻ2.67

The ɻ symbol comes from the junudertypatree, more info in plants section.

$X / 32.44 = ɻY

ɻY * 32.44 = $X

Rounded to nearest hundredth

Axolotlian Declaration of Independence

It is very unusually short:

The Colony of Atlantis declares independence from the United Kingdom as The Republic of Axolotlia. They have cruelly subjugated Axolotlian culture, and repressed any nationalism, including the worship of the Axolotl Gods and use of the Axolisc language, including numerous violent attempts by the British to stop Axolisc from splitting from English, using methods such as mass killing any speakers. They wanted to prevent Axolisc from diverging from English for reasons we are not even aware of. They have also treated the native Fentolese people and Bræ people poorly ever since they joined the Colony of Atlantis willingly in 1755, and stopped both groups from speaking the islands' sole native language of fentolese in public (fentolese is lowercase at request of the fentolese speaking community). We urge all of thou in the international community to recognize Axolotlia and what the UK did.

- February 24, 1974.

  [Signatures]

The UK accepted it the same day, but not without saying "We will recolonize you eventually…" they never succeeded (not without trying) and today (as of like a year ago) the two are allies.

Axolisc Axolotlian Declaration of Independence

It is very unusually short:

Þe owetacen ov Axolotlia moots ham sway fram þe United Kingdom as Þe Folkdom ov Axolotlia. Siþen þey habe harscly put adoon Axolotlian folkway ɛ put adoon ænig nationalism taceniniŋ þe worðscip ov þe Axolotl Gods ɛ werk ov þe Axolisc tuŋiŋ, taceniniŋ manig werlic bedans bi þe British to stop Axolisc fram brecaniŋ of ov English. Werkiŋ mænans swylc as bunch killiŋ ænig sprecrs.

- February 24, 1974.

  [Signatures]

The UK accepted it the same day, but not without saying “We will recolonize you eventually…” they never succeeded (not without trying) and today (as of like a year ago) the two are allies.

Governmental System

The country is broken in 4 layers with each having a government, with one person from each parts of the previous layer in the next (excluding national.)

National Gov: President and Vice President, 8 Governors, 30 Administrators.

Scireal Govs: Governor, and X Administrators

District Govs: Administrator, and X Mayors

Hundred Govs: Mayor, and 20 citizens

(Hundred is for cities and towns.)

For example, Arada Scire has 7 Admins, North and West each have 2. Spit District has 4 mayors because it has 4 hundreds, but Williŋ District has 1 mayor, the mayor of the city of Williŋ, so just 2 people in their government.

Nearly Direct Democracy

A proposal is proposed to a Government, if approved by more than half of that government, it goes to public vote on the next election day, usually the first of the next month. If it passes, that government will send it to the next layer up if it is intended for a higher layer.

Critical matters that have to go fast can skip the public elections and can be instantly sent to the next layer. What counts as critical?

A proposal is deemed critical if it is proposed by the leader of a gov (mayor, admin, governor, president/VP), or if in the public election the majority of yes votes check a box that says “Is this a critical matter?” in which case it will skip to the next layer and not require a public vote, the next layer’s gov can still repeal the critical status and put it to public vote though.

Governmental system

Each Scire gets its own governor. The governors, along with the President and Vice President, create the laws and stuff to improve the country. Every 2 years the governors are elected, and every 5 years the President and Vice President are elected. Dean has been elected twice back to back, (2017 emergency election, 2020 normal election), because he is so dang good.

Presidential elections are on every year divisible by 5, and in emergencies. The new minimum presidential age (set in 2018 after Dean got elected) is 10.

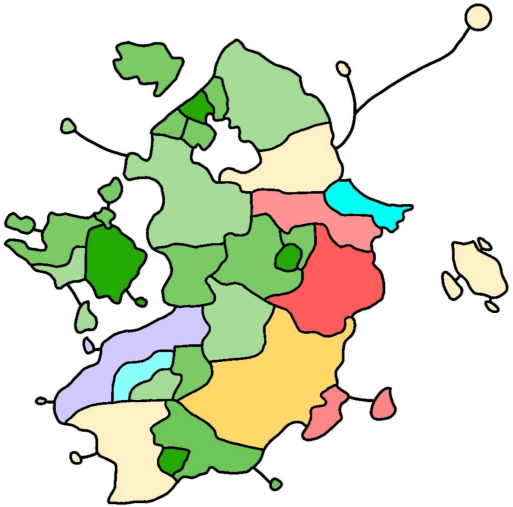
The center party is honestly kinda left, all the parties are shifted kinda left compared to other countries'.

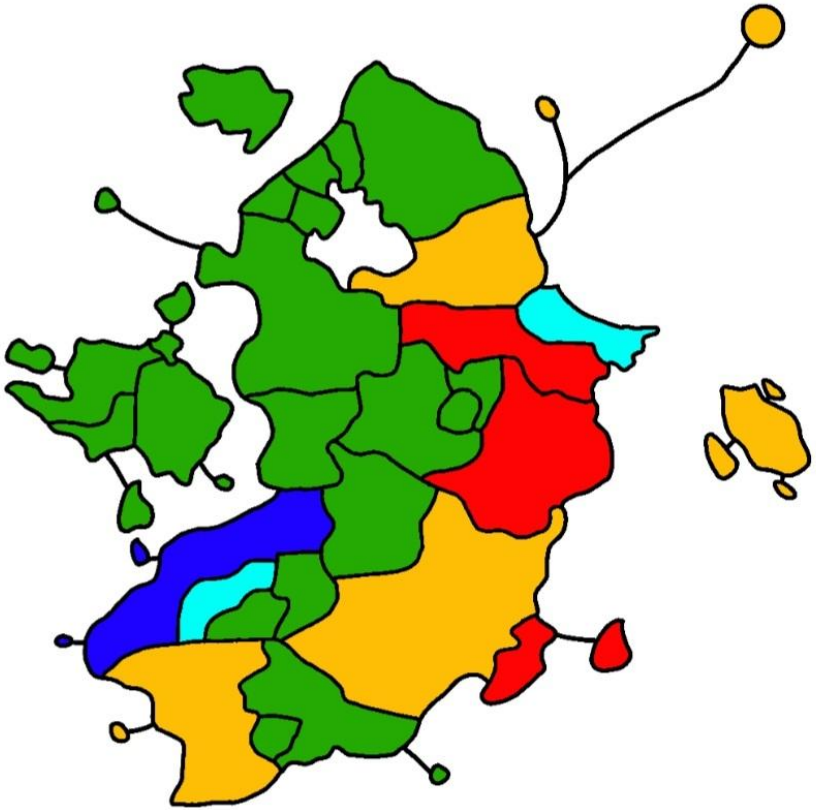
5 major political parties:

Hard Left **Left** **Center** **Right** **Hard Right**

2020 Presidential Election District Map

This means nothing for the actual election because Axolotlia counts votes directly, but it does show stuff, like the more urban a district, the more likely to vote Center.





Admin Parties as of Right Now

There are

1 Hard Left.

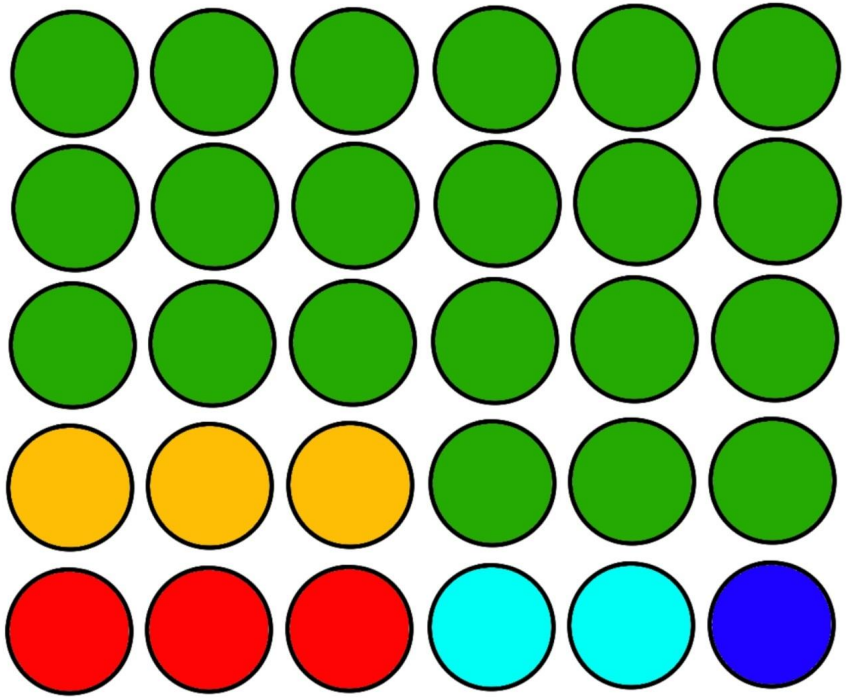
2 Left

21 center

3 right

3 hard right

This matches the Pres. Election map in prev. slide.



Order of Succession

In the event the president either dies or quits the following is the order of succession:

Vice President, Head of Defense, Randomly Selected Governors, Axoton Mayor, Emergency National Election with no restrictions, which was added after the 2017 emergency national election with no restrictions after the Pres, VP, all Governors, and Axoton Mayor died in cyberattack, Head of Defense also added.

The person who becomes president is replaced (VP stays empty until next election) and the cycle ideally repeats, AKA it goes back up to HoD.

As you can see, Axolotlia has lined up 11 candidates, in the event that the top 2 die or quit, one Governor will be randomly selected, if they die or quit, it is randomly chosen again, hopefully we never run out thanks to very fast elections, but if we do, an emergency national election is held with no restrictions.

Axolotlian punishments for crime

Axolotlia’s prison system is based on the nordics, they rehabilitate instead of punish.

Unique Laws

It is illegal to harass a gret while the gret is smoking. (Made November 23, 1999. Because a lot of teens gave grets cigarettes and then poked them.)

Car-centric development is illegal, only walkable cities with good public transit.

In cities and towns, at least 10% of the city must be parks.

It is illegal to assign more than 15 minutes of homework to a student per class. Homework can only be assigned to students that are failing.

It is illegal to look through somebody else's belongings, digital and physical, you may only look through what they specifically let you.

For every tree chopped down, you must plant AT LEAST one new tree somewhere in the country, it doesn't have to be where you chopped one down.

Unique Laws

In Axolotlia, it is illegal to…

1. Produce more CO2 than you remove,
2. Chop down trees without a permit,
3. Mine for coal, oil, or natural gas,
4. Litter, or throw anything recyclable in the trash.
5. Be a flat Earther, Anti-Vaxxer, or Karen.
6. Bring non-authorized organisms into the country, the unique ecosystem could be destroyed by plants or animals from other countries.
7. It is illegal to run with scissors. Up to a week in prison. If injuries occur, up to a month. If running with scissors in a crowded area, it is classed as an act of terrorism.
8. It is illegal to pass off AI generated content as non-AI generated. Doing so can lead to fines of up to 100AXW, 3,244 USD

Unique laws

Cigarettes and Vapes and anything with nicotine must legally be 5x the price of the highest price in other countries.

In Minift all buildings must have a basement, this is so every building has a protected area from the gargantuan sandstorms that can bury homes and sandblast stuff.

Crappy mobile game ads are illegal, although the law bans many other types of ads as well, it was very clearly made to target crappy mobile game ads, “Publicizing an ad that is not accurate to the average user experience, needlessly sexual, disturbing, or attempts to trick users into clicking on it, via fake buttons, fake playability, etc, is punishable by up to a 120 Waru (3,892.80 USD) fine.”

Unique laws

If you take advantage of the human nature to help others in need to commit a crime on them, you get extra punishment (ex: somebody knocks on your door in a panic asking you to help them because they are injured, but when you open the door they knock you out and rob you. Or scamming friendly old people out of their money while pretending to be their wrongfully imprisoned grandchild.)

It is illegal to force pets to eat diets that are not compatible (eg. vegan dog/cat) it is animal abuse and depending on the case, it could lead to prison or high fines.

Misleading advertising is illegal, like a sign saying $1 with .99 being super tiny.

Also cancelling something must be “feasibly and practically possible and easy to do.” Unsubbing from an email newsletter cannot take more than 10 clicks and must be finished in at most 5 hours.

Unique laws

There cannot be more than 30 seconds of ads per 8 minutes of footage when in video format, and when not in video format, ads cannot take up more than 10% of the screen. This goes with the previous ad laws.

Self driving cars are banned, unless they agree to a very long list of rules, which none of the self driving car companies would ever agree to. In fact all cars in Axolotlia must be built in Axolotlia to Axolotlia's demands, the demands are super strict and not following them to the letter can result in hefty fines.

Also every 1 mile of driving costs 0.10 AXW.

Right to Roam

Right to roam (Axolisc: Rihtan to Wɛrian) is very upheld and quite expansive in Axolotlia, basically right to roam is the right for an individual to go on and sometimes stay on private property so long as they respect the ownership and do not profit from it.

About 87% of Axolotlia is roamable, meaning 87% of the country is campable.

“Axolotlia shall not stop folks from wandering the islands as much as they want, unless the folk is actively doing bad stuff to property, if a property is being unused it shall be wanderable.” - The Axolotlian Constitution.

“Axolotlia scel not stop folks fram wɛrianiŋ þe ilands as micel as þey want, unlæsa þe folk iz bisigly doiŋ del þiŋs to a folk’s lɛ, if a folk’s lɛ iz being unwerked it scel be wɛrianable.” - The Axolisc Axolotlian Constitution

Laws

Getting in contact with a company customer service must take at most 1 hour and cannot use any bots. Any company that fails to comply cannot do service/operate in Axolotlia.

Axolotlia doesn't use size based fishing, because it breeds smaller fish, previous laws were replaced in 2019 in favor of this.

If enough info comes out that a chemical is dangerous, it is rapidly banned from the country, recently for example is PFAS, which is a super big deal and > 90% have in their blood in measurable amounts and causes issues I heard from MinuteFood. So any and all PFAS is now illegal.

“Stupid People < Animal” Law

If you are knowingly stupid to wild animals and they hurt you, you can’t do shit and the animal isn't punished or killed. Is a werbrid doing literally nothing in the woods minding its business in its natural habitat and you start provoking it and it hurts you, the werbrid is often praised and you are punished, good thing it wasn't an Axolotlian Great Brown Gorilla, because you would be dead and it would not be killed, if it were even found.

In the US, the animal may be euthanized, in Axolotlia, the situation gets jokes on late night TV and memes.

Legal things that make no sense

It is legal for citizens to own tanks. You just can’t use it in public, but you can use it on your own property and at “tank centers”, places where people can use their own personal tanks or tanks owned by the centers.

It is legal for somebody to murder, if the victim gives written and recorded consent on video. You must record the victim both verbally consenting and while they write the consent to be killed. This “law” only exists due to 6 loopholes and 11 conflicting laws and this “law” is not recognized in Arada, Coast, Lucin, Capital, or Bræ Scires, or in Wellinŋville, and 12 other cities not in the specified Scires, the victim must show no signs of distress or have been forced to consent, all of it must have taken place in a police station.

It is legal to slap flat Earthers, anti vaxxers, and people being assholes in public (such as karen's harassing ordinary employees doing their jobs.)

Axolotlian Measurement System

Axolotlia uses the Imperial Systems of Measurement (Imperial isn't one system, see jan Misali's defense of Imperial video).

A unique new measurement used in Axolotlia is for fog, because it is so foggy so often in Northern Axolotlia, Axolotlia made a specialized index for it. FVI (Fog Visibility Index) it is 0-20.

0 = extreme fog: you cannot see. 10 = medium fog: you can see ok. 20 = no fog: clear day.

I don't know where else to put this so… when it is a clear night with bright Moon, "Moony" is often used like how "Sunny" is used. "It will be sunny today and moony tonight", for example.

YYYY-DD-MM. Because fuck thou.

Yardlongs

Axolotlia scraped the mile a long time ago, given it isnt from the same system as feet inches and yards. They adopted the yardlong. 1 yl = 1,200 yards (.

12 in = 1 ft, 3 ft = 1 yd, 1,200 yd = 1 yl.

1 mile (ew) ≈ 1.46667 yardlongs

1 yardlong ≈ 0.6818 mile

2 miles * 1.46667 = 2.9332 yardlongs, for example.

Yardlongs are so much simpler. 1,200 vs 1,760. Which is simpler.

Axolisc: Gerdloŋe

Getting Citizenship

The easiest way to get citizenship is to go to Axolotlia, and apply at a government office, you will most likely aquire citizenship. You can also do it online.

Axolotlia also grants citizenship to people who enter Axolotlia illegally… I will let you think why… got it? The only way somebody could get to Axolotlia illegally is if they somehow got to Axolotlia by the ocean, Axolotlia is in the middle of the North Atlantic with the nearest other country being Portugal's Azores Islands, it would take days by boat or weeks by raft to get to Axolotlia, so you will get citizenship, this law dates back to early colonial times and was simply never updated or changed.

The only time Axolotlia has granted citizenship in the second way was when Frederick Planter rafted to Axolotlia when his fishing boat ran out of fuel in 2008.

Policies

President Dean has recently been trying to push for a decisive end to Life Inc.

“The fact that Axolotlian folk are still being neo-enslaved by Life Inc. in the year of Twenty Twenty Fucking Four is unbelievable, the military has sieged Lifeton for nearly a decade and they still are bringing new slaves in. We have the ability to end Life Inc. yet we haven't, and it shows to me that this government is not fully dedicated 100% towards our folk, I am a fucking teenager and can see this. My dad, the head if the fucking military has ordered an end to Lifeton many times and every time has been ignored. I am about to personally fire and arrest General Braxton for TREASON unless he gives a damn good reason for why Lifeton is still operational.” President Dean, September 2024.

Braxton has avoided responding but Dean cannot fire him because of a contract :(

Government Agencies

The Axolotlian Government has many agencies and services, like the government itself, the military, postal system, garbage, sewage, electricity, blah blah blah, but there are some that are quite unique.

Many government agencies are not here, either because they aren't yet created, not interesting (Postal service probably need not a slide), or are already well documented in other areas (the military has its own damn section for crying out loud.)

National Axolotlian Weather and Geologic Service

The National Axolotlian Weather and Geologic Service (NAWGS) measures, tracks, reports, and alerts Axolotlian weather and geology, such as volcanoes, quakes, hurricanes, sandstorms, tsunamis, and more.

If a natural disaster is detected or likely in your area, NAWGS will be the service to send the warning to your phone, TV, computer, or smart home device.

It is one of the largest and most expensive services because, safety. Axolotlia has active volcanoes near large cities, and lots of other natural disasters all over the place.

TAGPLIPoFNSIP

“The Axolotlian Government Provided Life Inc. Protection of Former Neo-Slaves Initiative Program” (TAGPLIPoFNSIP, yes seriously, that whole thing is the full name.) TAGPLIPoFNSIP protects former neo-slaves who escaped Life Inc., because when a neo-slave escapes Life Inc., they often send people after them.

Life Inc. tries hiding TAGPLIPoFNSIP from their neo-slaves, but when a neo-slave escapes, TAGPLIPoFNSIP posters hit them like a truck, hard to miss when posters cover street posts in a 5 mile radius of every open Life Inc. store.

TAGPLIPoFNSIP is comparable to the US’ Witness Protection program, but it is harder to relocate when the whole country itself is only 40k square miles, an island in the middle of the North Atlantic, and you only have 1.89M residents to blend in with. And the most secluded hiding spots are small towns or cabins in the woods. When it is not possible to hide somebody from Life Inc. TAGPLIPoFNSIP just gives them a gun.

ACDCA&P

The Axolotlian Center for Disease Control, Analysis, & Prevention (ACDCA&P) sometimes shortened to ACD or ACDC, not the band, is self explanatory, it tracks and analyzes and fights diseases, which is not that unique. What is, is that it also tracks malware.

The ACDCA&P tracked the I Love You virus for example, and they even have their own highly rated antivirus called “ACDCA&P Antivirus, Computer Protection System for Mobile, Desktop, Laptops, and Other Smart Devices.” The acronym is ACDCA&PACPSMDLOSD. Usually it is just called the ACD Antivirus.

Axolotlian Fare Folkscip

English: Axolotlian Transit Organization

Yeah boy anti-car dependency.

There are railroads with regular service to most towns on the islands, including a bridge over the Norbridge Channel to connect Main and Bræ Islands.

The trains are not the highest speed in some places, but Axolotlia is not too big, so it isn't a big deal. The trains go through the gorgeous countryside and are amazing to ride.

In each city, there are buses everywhere, and even trams and subways that directly connect to the intercity trains.

Rail Network: AFF

Almost every town is connected to the Axolotlian Rail Network.

There are 3 lines that form the Backbone of Axolotlia from the north to the south:

Axoton - Grest-Powderville - Grenton - Grentburg - Lifeton - Willing: The Eastern Topdown Line.

Axoton - Wellingville - Walkerton - Lockerton - Plorburg - Minift - East Bank - Willing: The Western North-South Line.

Willing - Perscon - Yasceð - Ikno - Yoseenton - Citytownvilleton - Scink - Lucinia:Lucin River Line.

Multiple lines connect the Eastern and Western lines.

Axolotlian Space Program

Visit the Axolotlian Technology section. It is a government program. It's logo is this.

Axolotlian Extreme Crisis Plans

Axolotlia has emergency plans for almost any situation.

For one example: Axolotlia has a plan for what to do if… a gang takes control of Grenton and is supplied by foreign enemies and starts pushing into nearby areas, Lifeton declares independence and Life Inc. uses all of its nationwide stores to attack Axolotlia while pushing past Lifeton, multiple foreign enemies all start cyberattacking Axolotlia destroying the nation's ability to respond, the seismic activity of the inherently volcanic island starts ramping up leading to nationwide eruptions and earthquakes, and also it is all happening during winter and foreign enemies are invading and finally NATO & the UN won’t respond for some reason.

All simultaneously. Some call Axolotlia paranoid, some call it proactive, when in reality, it’s just bored and planning for nearly impossible situations for fun. No, I will not be leaking these extremely classified plans.

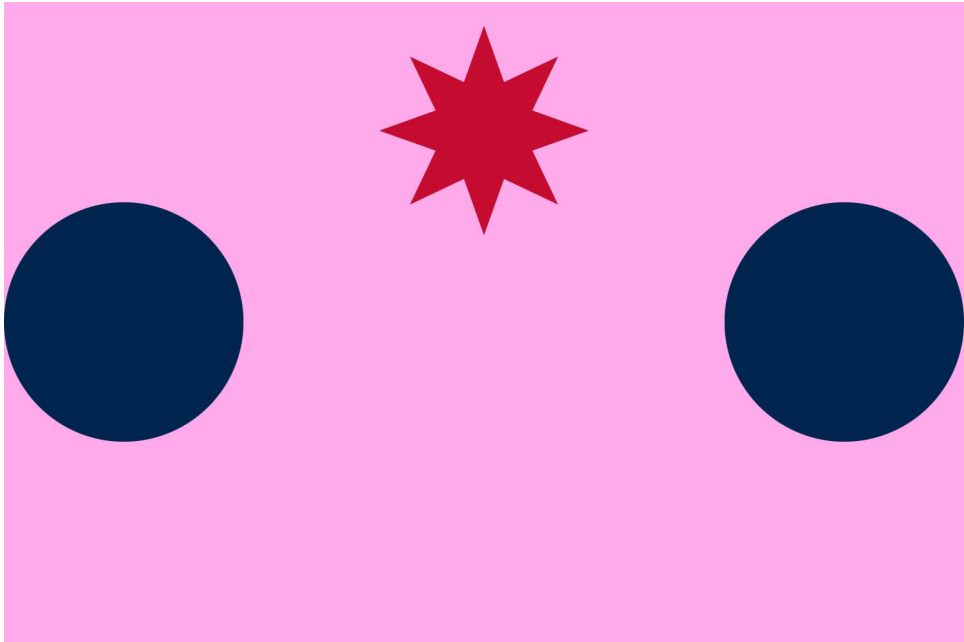
Axolotlian News Channel: AXNC

Axolotlian News Channel is the national government's news channel and is the biggest and most trusted news channel in Axolotlia. They released one to the government YouTube channel about government drone footage. They may make more for the Government YouTube Channel.

Flags

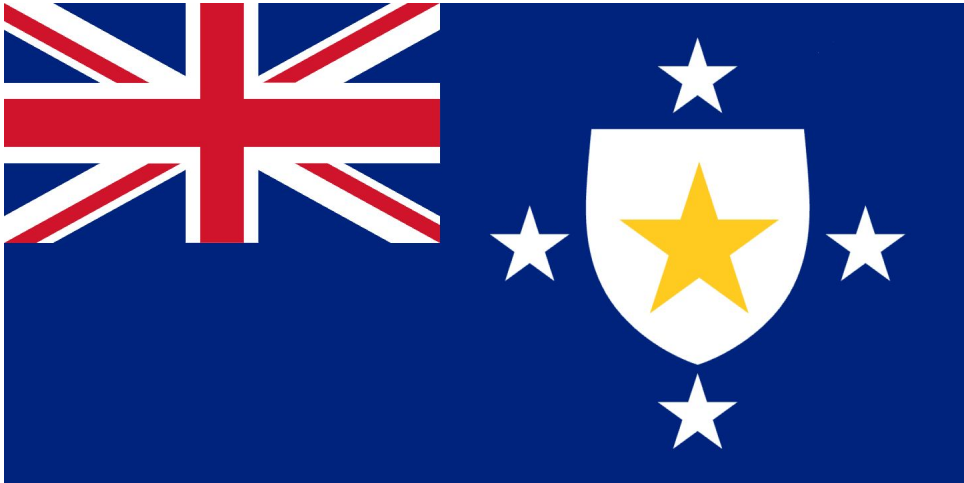
National Flag

Check the previous section. Some notes: The circles are in diameter 1/3 the height of the flag, and the star is idk just look.



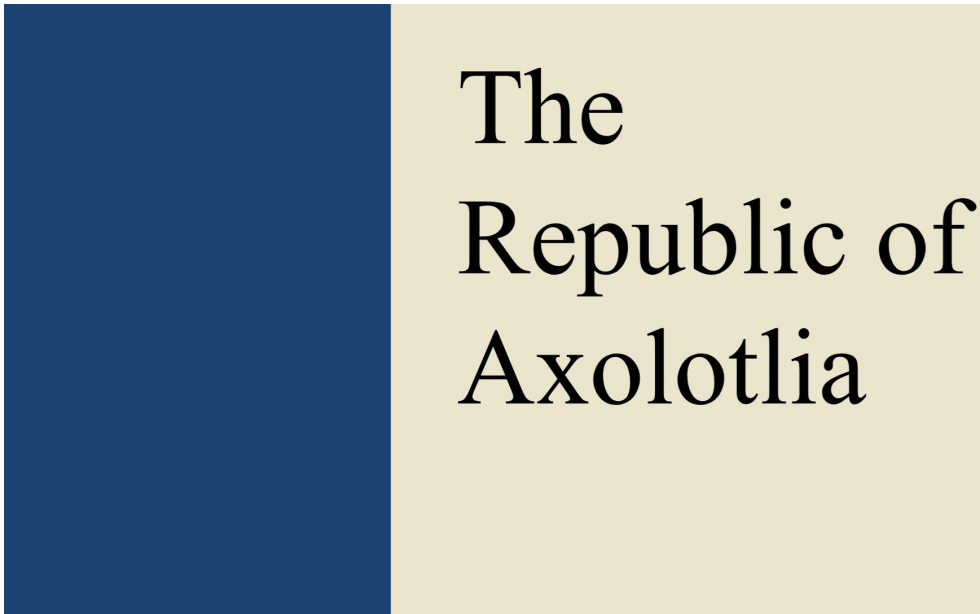
Colony of Atlantis Flag

Check history section



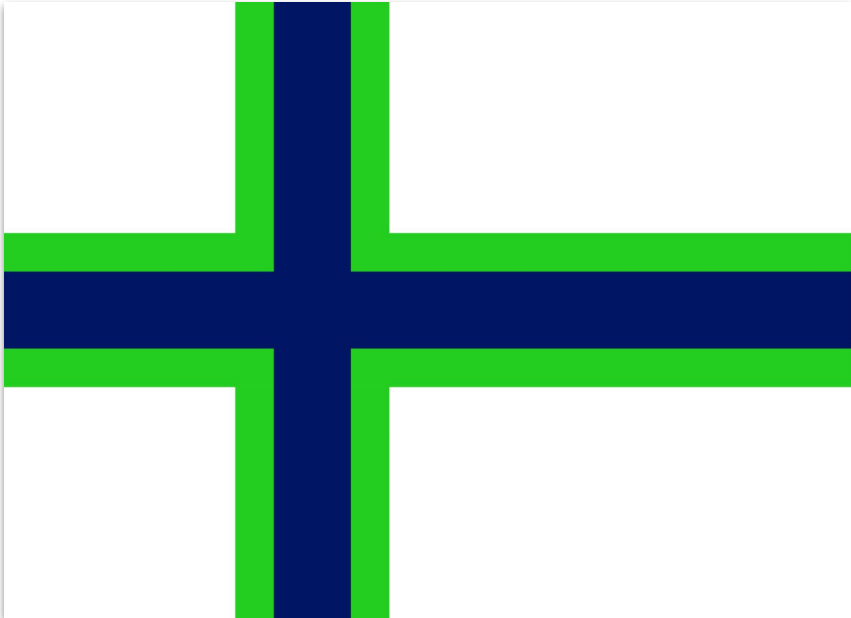
Independence Flag

Check history section for more info on it.



Limerwhisk Flag

The Limerwhisk flag is a nordic cross with a white background, for the snow in winter, green outline for the greenery, and dark blue cross for the rich blue waters in its rivers and the ocean.



Bræ Flag

Null

If you want you can make one put it in the discord server and it will likely get added.

You will also be credited.

It is for the island of Bræ and all of Bræ Scire.

North Atlantic Empire of Atlantis Flag

The 5 pointed star represents the 5 native tribes that were there before the colonists peacefully took over the Axolotlian Islands, the Fentolküa (Fentol Empire), the Bræic Kingdom, the Lucinian Tribes, the South Fentol Tribe, the Desert Nomads.

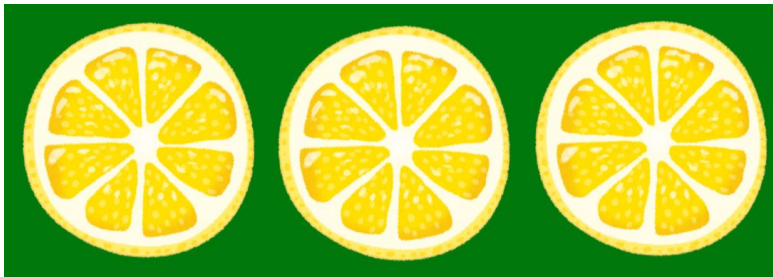
The green spikes represent the trees.

The snowflake represents the fact it was snowy.

Lifeton Flag / Banner

This is the flag that flies over Lifeton, it is the Life Inc. logo without the text repeated 3 times across an absurdly wide green flag. It is officially called the Banner of Independent Lifeton but everyone just calls it the Life Inc. Flag, Lifeton Banner or, Lifeton Flag.

It is unofficially nicknamed the flag of neoslavery, and represents the biggest fault of Axolotlia.



Economy

Major Exports

Axolotlia exports many things, here's a list of some unique ones:

Nimberberries: a superfood, see in plants section, one of its most famous exports.

Bræ Wooly Cow Wool: see animal section, a very expensive fiber farmed only in Axolotlia.

Pumice: Lake Axolin has a ton of pumice, see in Maps & Geography section.

Tech: see tech section.

Tourism

Axolotlia has a huge tourism economy, as people visit from around the world to look at Axolotlia’s cities, culture, environment, land axolotls, and grets.

They often visit many tourist traps like the Axoton Axolotl Statue of Worshipping, despite locals pleading to respect it, and they ride on trains to gawk at the beautiful untouched forests. They also buy local foods that are extremely expensive elsewhere, like nimberberries, and they try to pat grets despite everyone saying “Don't do that, there's a reason ‘when someone pats a gret’ is a metaphor for the impossible. Thou got scratched and bitten? I told thou so.”

Also, they visit to see the infamous semiterrestrial axolotls that can breathe on land in the rain with their gills.

Animal Farms

Meat and eggs are the most expensive in the western world, because legally animal cruelty in farming is illegal,

All the animal products are about 50% more expensive on average. Like not that much.

Given Axolotlia’s development and currency this is nothing.

Labelling is regulated.

https://youtu.be/5sVfTPaxRwk?si=vV28dbir6hRJGCYz

Education

Online Education

Ever since Covid-19, remote learning has been maintained just in case, you know, something happens again, also for kids who are out sick. Paper is increasingly rare in school and most assignments are fully available online, you never know if a student will get sick and need the online learning, or maybe another lockdown is needed.

Geography

Axolotlian education emphasizes geography, global and national.

They teach the following continent model: North America, South America, Eurasia, Africa, Oceania, Antarctica. Sometimes in Axolotlia, Oceania includes all of the Malay archipelago, about 7% of students are taught that model.

Axolotlia is said to be part of North America.

Due to Grentons's nearly decade long lack of functional government, some schools in Grenton teach the Middle East as a separate continent.

Real time updates

Every year the system is updated with the newest knowledge, if a groundbreaking discovery changes something, it will be taught immediately.

Mostly because Axolotlia uses online resources and learning, like online actively being updated textbooks, and for some reason Wikipedia is allowed in schools.

School Bus

Axolotlia uses almost exclusively imported US school buses, but they're rare because Axolotlian kids can use the already existing public bus system in big cities. School buses are mostly seen in the rural areas.

They tried using something ridiculous for a moment in 2016, Electric Bi-Articulated Busses, (3 section bendy busses). They were so expensive and so over capacity that only 20 remain in use, all in Axoton where they rival the public transport enough to be useful.

Planets

Axolotlia teaches the planets and dwarf planets together. There are the 8 major planets and the 9 dwarf planets, in one list. Because Axolotlia believes that the term planet has 2 subcategories, with major and dwarfs both equally important.

Mercury, Venus, Earth, Mars, Ceres, Jupiter, Saturn, Uranus, Neptune, Orcus, Pluto, Haumea, Quaoar, Makemake, Gongong, Eris, Sedna.

Unsurprisingly there is no debate on whether Pluto is still a planet in Axolotlia, of course it is, it just was the start of the new category of planet.

Axolotlism Religion

Check out the Minecraft religion

It is a separate Minecraft themed project distinct from Axolotlia that Axolotlism is based on. It is called Axolotlian.

Axolotlism Basics

Axolotlism is a polytheistic religion with 5 to 8 Axolotl Gods.

The term for a follower of Axolotlism is an Axolotlite.

40.2% of Axolotlians are Axolotlites, or ~762k people.

There are 983k Axolotlites globally.

The religion started as a half joke in 1924, but it spread and is today a full scale recognized religion, the largest in Axolotlia.

In Axolotlism they worship the Axolotl Gods.

It is one of the major influencers of the name of Axolotlia.

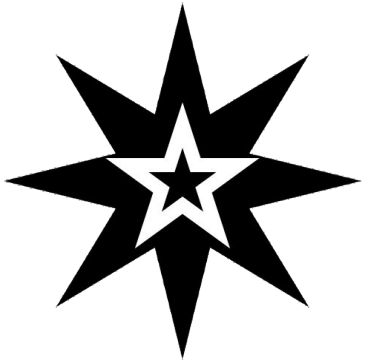
It has 2 afterlives.

Symbol

Much like how christianity has the cross and judaism has star of david, Axolotlism has a symbol, a 5 pointed star in an 8 pointed star.

The 5 pointed star is the 5 alive gods, and the 8 pointed star is the total 8 gods.

Coincidentally Axolotlia has 8 Scires, and some theorize that when the Scires were being redrawn at independence, they were specifically made to 8 for the gods, but no. It is a coincidence, 8 was a more stable setup with no needlessly small Scires.



Three Branches of Axolotlism

There are three branches of Axolotlism that come down to which gods are dead and which are alive. Nobody argues, they respect each other’s opinions.

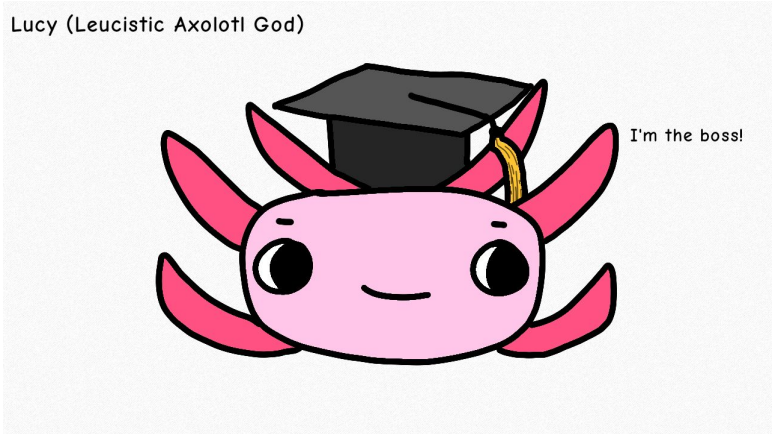
Branch one, Bigwerers: Half dead, after the Battle Of The Gods, a few died (Swagxolotl, Buffxolotl, Mosser, etc.) The most popular branch, about 78% of Axolotlites are Bigwerers.

Branch two, Lifers: All alive, after the Battle Of The Gods, they did die, but then they came back to life because they are gods, immortal beings. Second most popular.

Branch three, Deaþers: All dead. Because, after the Battle, some died. So the gods are not immortal, and because it was so long ago, the rest died of old age.

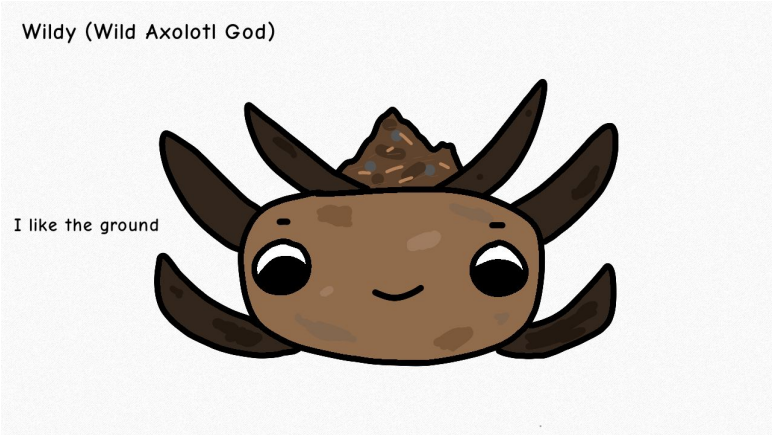
Lucy (Leucistic Axolotl God)

Lucy is the leader / boss of the Axolotl Gods. She makes sure the other axolotl gods are doing what they’re supposed to. She always has the final say. She is the only one without control of anything in the Universe. She knows what has to happen and she ensures the others get it done.



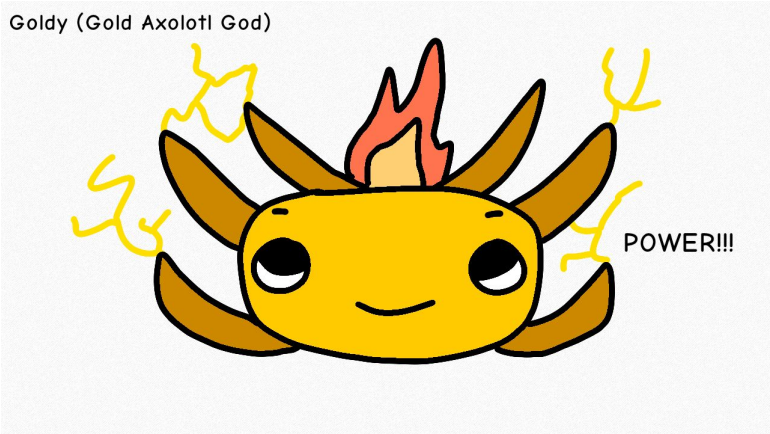
Wildy (Brown Axolotl God)

Wildy controls all things related to the Ground. Rocks, minerals, tectonic plates, etc. After the Green Axolotl God died, he took control over the plants, fungi, and ground dwelling bugs.



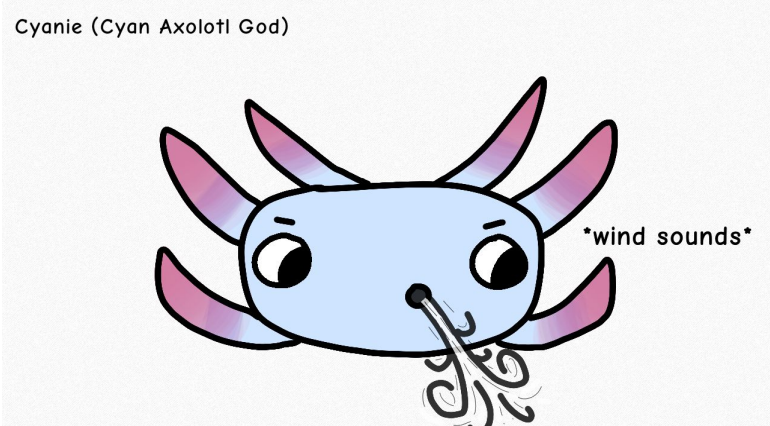
Goldy (Gold Axolotl God)

Goldy controls all things power, Electricity, Heat, Light, Fire, Plasma, & Stars. She got mammals, reptiles, and non flying birds after green died.



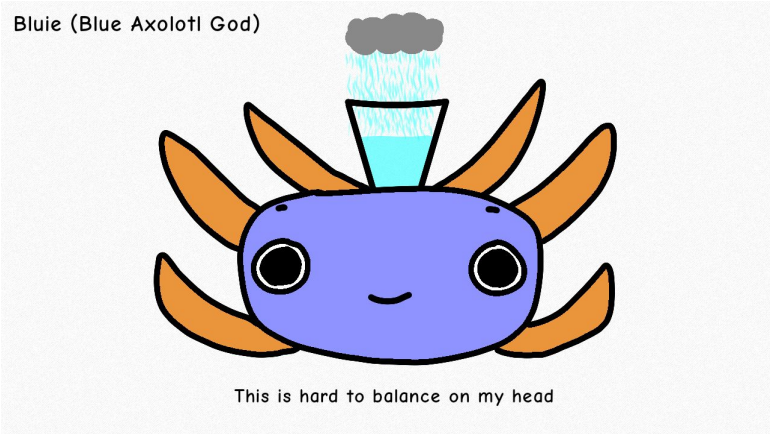
Cyanie (Cyan Axolotl God)

Cyanie controls the Sky; weather, water in the air, wind, etc. He makes the wind by eating beans and/or blowing. And if he’s angry, then he will stomp, making the thunder, the lightning he borrows from the Goldy. After green died, he got the flying life, and microbes.



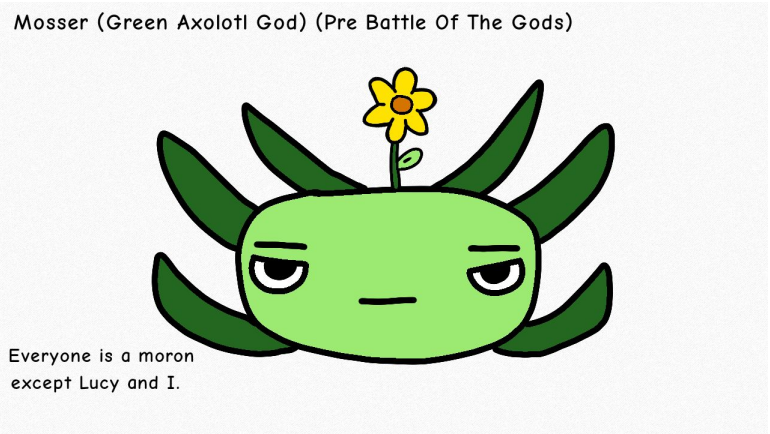
Bluie (Blue Axolotl God)

Bluie controls all things that have to do with the chemical compound of two hydrogen atoms and one oxygen atom, also known as H2O, or Water. All oceans, ice, lakes, puddles, and after green died, sealife.



Mosser (Green Axolotl God)

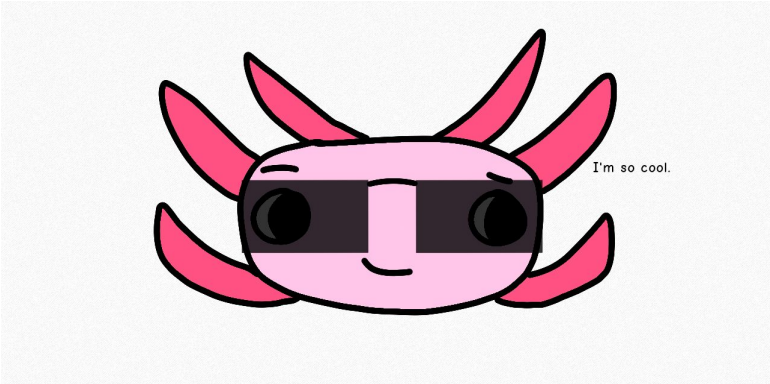
Mosser was slain in an ancient Battle of The Gods, he was ruler of life (Fungi, Animals, Plants, and Microbes). Was the 6th major god until his death and was one of the first, he joined after the Wildy and before Goldy.



The Swagxolotl God

The Swagxolotl God was so swaggy one day during the Battle of The Gods, he just kinda overloaded the universe and exploded. He was the ruler of all things epic. After he died epicness was never divided between the other gods and now it is left to do it’s own thing.

Joined 8th, after Green and Buff.



Buffxolotl God

Buffxolotl was the one who helped mush the rock and stone that makes up the Earth and Moon and Planets and shit. He was crucial for the creation of the universe because the other gods got really bored of just empty nothingness. Especially with the lack of solid ground causing all the living stuff to just die.

When he wasn't building or working out, he studied philosophy.

Joined 7th.

Also died in the Battle of The Gods.

He was not the ruler of anything.

Teamwork

The gods have to work together to keep the Universe up and running. Many things are controlled by multiple gods, like lava, a collab between Goldie and Wildy, and the weather, a teamwork between many gods. Lucy makes sure squabbles don't cause collapse of order. All of the gods are equally important, and if any one god stops doing their job, the balance of the Universe would be ruined, like what happened after the Battle of The Gods.

Axolotl Statues of Worshipping

ASWs (Axolotl Statues of Worshipping) are large concrete statues of the faces of the Axolotl Gods spread throughout the Republic of Axolotlia in its cities and towns.

The most notable is the Axoton Axolotl Statue of Worshipping in the capital, Axoton, a 22ft tall face of Lucy, in the center of the city, surrounded by a park. It is most known worldwide for its destruction via office paper shredder during Canada's occupation in the invasion in 94. It was the first ASW built, built in 1990.

Minift has one of Goldie, the Gold Axolotl God, at about 20.5 ft, it is the second biggest. Lucinia has one at 20ft tall and it is of Cyanie, the cyan one. The statues often have smaller ones of the other gods nearby, Lucinia did take it a step further by building a 20ft statue of every one of the 5 gods, all together in one park. Axoton did too but they are 15ft tall and not next to the Axoton Axolotl Statue of Worshipping, as they are in a separate park and are much newer, built in 2014. Lucinia also built statues to the dead gods.

Waterless Week

The Waterless Week is the week of the closest full Moon to the summer solstice, during it Axolotlites cannot rehydrate by drinking, they must get their water from foods. Some popular choices are berries, apples, popcicles, and the most common and somewhat stereotypical, watermelon.

The Waterless Week is in solidarity with the Axolotl Gods during the Battle of The Gods.

For the Deaþers branch it is simply the week of the summer solstice.

Axolotlian Afterlife: Neþr

Neþr is an infinite fiery wasteland where the dead are doomed to wander for eternity, fighting off demons and trying to survive, there are various regions in Neþr, such as volcanic basalt areas, blue and red forests, sandy areas where ancient bones exist, and vast lava oceans and lakes, with lavafalls being common, and wastelands with nothing unique to them. There is an impenetrable roof over Neþr, keeping everything in, and an impenetrable floor deep beneath the blood red rock.

The demons will try to torture you, you have to fight them off to avoid torture, if they catch you and torture you, you will have a very bad time, they will torture you for years before releasing you to continue the chase.

You can use the resources found to try building a life, but certain demons can fly and shoot explosive fireballs to destroy your shelter to continue the fight.

Axolotlian Afterlife: Æþr

The Æþr is Axolotlia’s version of heaven—an infinite realm of floating islands filled with wonders like unicorns and various creatures. There is no harm, and plenty of luxuries.

If you fall off the islands, you safely return to your bed but lose your belongings, which fall endlessly. The islands vary—woods, fields, lakes, mountains, villages—and are connected by bridges, allowing travel even if neighbors aren’t directly linked.

You can live happily there by building a home, meeting others, and keeping your pets with you.

The Axolotl Gods live here.

Cities and Towns

City Vs Town

The difference in city and town in Axolotlia is purely populational, the reason on the map towns are yellow is just to show that they are usually not as important to know as cities.

Mini countries are cities and towns but they have a few distinctions listed on the next slide.

The minimum population for a town is 200, any less and it loses town status, it is then considered a village and won't show up on maps, the vast majority of settlements in Axolotlia are villages or hamlets (199 people or less), which do not show on maps.

The minimum population for a city is currently not important to know (not that i don't yet have one because i haven't reached that point…)

Mini countries

For the Government to consider a location a “Mini Country” it needs 3 things:

1. A lack of control by the Federal Government in Axoton. Meaning either a local government is not listening to Axoton, or there is no local government.
2. Separate or complete lack of federal law enforcement. The local government is not enforcing Federal Laws and is instead enforcing local laws, often these laws are considered illegal by Axoton. Or there is no law enforcement.
3. No travel between Axolotlia and the local area. The Local Government is preventing travel of its citizens in some way, either the citizens are too poor to leave, it’s too dangerous, or it is outright considered illegal by the Local Government.

Mini countries are bad, it is a legal designation that basically says “Stay away.”

Cities Populations

The 14 largest cities by population in order from biggest to smallest.

Populations may vary by up to 1%. Pie chart matches list below. Many cities that should be on the list and chart aren't.

Axoton 517,000
Minift 360,000
Lucinia 267,000
Perscon 126,000
Scink 118,000
Williŋ 80,000
Bræ City 55,000

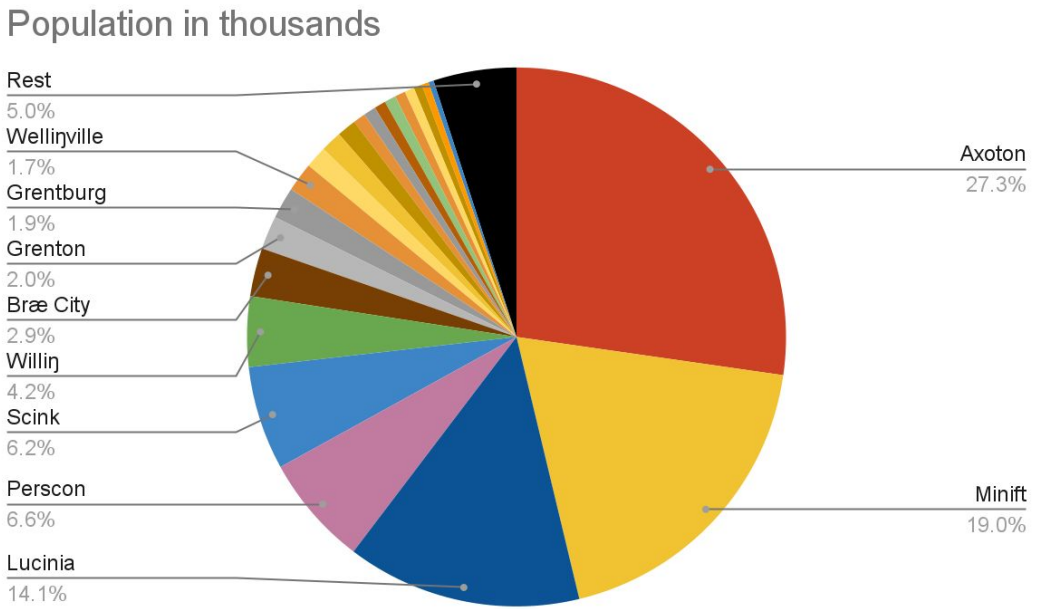
Grentburg 36,000
Welliŋville 33,000
Lockerton 25,000
Plorburg 24,000
East bank 22,000
Grentville 14,000
Walkerton 14,000
Grest-Powderville 13,000
Rest a lot idk



Cities’s influence

In Axolotlia, cities have spheres of influence, where larger cities can influence nearby smaller cities and towns, while also being influenced themselves.

Think of it like a tree, with Axolotlia as the trunk, Axoton, Minift, and Lucinia as the first three biggest branches, and it spreads down, if something happens in Lucinia, nearby cities will feel the effects, and it ripples down, if something happens in Minift, Bræ City likely won't feel it's effects very much, but Plorburg and Lockerton likely will.

Axolotlia defines a Satellite Town as “A town that is economically, and socially, reliant on a much larger, nearby city.”

Axoton

Axoton, as the capital, is the most important and influential city in Axolotlia, it is the largest city by land area and by population. It has a coast on the Atlantic Ocean and on Lake Axolin, the River Axolin runs down the middle of the city, splitting it in two.

It is cold and wet, it rains a third of the year, and snows another third, the rest is mostly foggy. It is so large, it’s effective sphere of influence is the whole country. It has the 1st and 3rd largest of the 6 international airports.

It is three capitals in one, Axolotlia, Capital Scire, Axoton District.

It has 8 satellite towns.

Minift

Minift is the second largest city in Axolotlia with 360k people. Often called Axolotlia’s Vegas, possibly because it is in the middle of the Arada desert.

It has Minift International Airport, the third Largest in Axolotlia. And North Minift Int. Airport, the 5th largest.

Minift is the second largest city in Axolotlia, and capital of Arada Scire, it doesn't border any rivers or lakes or coasts, so it imports water from Lake Flud and the Sterklono River via long massive pipes, big enough to drive in, that transport river amounts of water.

In pre-European times it was the de facto capital of the desert nomads.

It has 6 satellite towns.

Lucinia

Lucinia is the third largest city in Axolotlia, it is the capital of Lucin Scire.

Named after the Lucin river, which is named after the many leucistic axolotls in the river.

Located on the Lucin River, very near the southern coast, Lucinia is split in three by the River, part on the northern side, part on the southern side, and a large chunk on an island in the middle similar to Montreal.

Lucinia is unique, because it technically has only 3 satellite towns, and is so close to Scink (5th largest city) that one town is essentially split between the two in terms of influence, Scink is of course influenced by Lucinia, but they are so close to each other, they both influence each other heavily.

It has the 4th largest airport in Axolotlia.

Perscon

The 4th largest city in Axolotlia, Perscon is… Perscon. I do not know what to put here, I only made this slide to fix an error I had made, where I accidentally had put Scink as 4th.

Persconans are very vocal about things they do not like, there have been 422 peaceful protests in Perscon in the last 3 years, more than any other city in Axolotlia. Usually about minor things like the local metro being delayed by a minute or the local Subway running out of olives.

Perscon is the capital of Coast Scire, and has no satellite towns. Perscon is very tied with Willing, and both coordinate on a lot of things.

Literally nobody remembers what it is named after. It can be pronounced as Per-shawn (official), or Per-shone.

Scink

Despite being a city near the larger Lucinia, it is so similar to Lucinia in size, it is not reliant on Lucinia in any way. It is the 5th largest city in Axolotlia, and is the largest city not a capital of any Scire. It has 2 satellite town, one being shared with Lucinia as a satellite.

Both satellite towns are a bit iffy, one is shared with a larger nearby city, the other is just quite far away, hardly linked to Scink. (Ha, linked to Scink rhymes.)

Its sphere of influence lies within Lucinia's, but is similar in influentiality, due to the similar sizes of the cities.

Named after the city’s shrinking river width during the early years of the city’s history, the river did eventually stop shrinking and regrew, it is missing the r due to a simple misspelling on some paperwork.

Williŋ

Are you Willing to read this? Eh? Eh? Fine, I'll see myself out.

Williŋ is the Northernmost city on the Lucin River, located at the very start of the river, and is Fluke Scire's largest city and Capital with 80k people, the biggest city with less than 100k residents.

Bræ City

Bræ City, Axolotlia's 7th largest, named after Bræ island, which is named after the Bræic Kingdom, is built on the same land as the ancient capital of the Bræic Kingdom "Bŕæasküo" (translation: Bŕæas-Bræ, küo-City, Bræ City), because of that, it is filled with archeological sites, you can't build without finding something of extreme historical value, "Oh, thou dug up an ancient temple with a well preserved statue of a god worshipped by the Bræs? How did thou do it!?" "We were making a basement." - actual conversation between the mayor and a construction crew during a televised interview (The temple forced the basement to be cancelled because the property had to be destroyed for the public good, the person living there got a free house nearby.)

Bræ City has 6 UNESCO World Heritage Sites, and 55-94 museums, Bræ City has a unique identity that very much embraces their name and land's incredible history.

Bræ international airport is the final international airport.

Bræ City

In fact, Bŕræasküo is the same city as Bræ City, as Bræ City was continuously populated ever since Bŕræasküo, it has simply changed names. The name of Bræ City in Fentolese is still Bŕræasküo. It is also technically speaking in a weird way correct to say Bŕræasküo is still the capital of the Bræic Kingdom, because Bræ Scire is directly derived from the Bræic Kingdom and Bræ City has always been the capital of the landmass that runs Bræ Island.

It is on the coast of Bræ Lake, a large endorheic lake on the island, the lake is not salty though because it actually has a secret output that feeds the Souþiŋ River.

Bræ City has 55-94 museums depending on if you count preserved ruins accessible to the public as a museum.

Wellinŋville

Wellinŋville is the Capital of North Scire, also it's largest city, though Walkerton is more popular to tourists as it is on an island on the coast in a small gulf-like bay area thing called the Walker Lagoon. Wellinŋville is on the shore of Lake Axolin and acts as one of the bigger ports in the lake and Scire, has a military base.

It used to be the historic capital of the Fentolküa (the Fentol Empire) in pre-European times, where the Capital of the Fentolese was called Fentoleseküo (again, küo means city in Fentolese.)

Grest-Powderville

While nowheres near the population of the previous cities, Grest-Powderville deserves a slide, it is the location of the Grest Powder Company's headquarters and labs, and is where Dr. Grest Powder was born and lives. Grest-Powderville renamed to this when Dr. Grest Powder donated the equivalent of 5,000,000 USD to the city in 2012 to renovate the old elementary school, it was previously known as Uxolinton. Its population of 13k makes it the 14th biggest city.

Unlike Lifeton, Life Inc.'s headquarter town, the Grest Powder Company (GPC) does not own or operate Grest-Powderville, Grest-Powderville and GPC are separate but closely linked entities in a mutual relationship, GPC makes Grest-Powderville money, fame, and aid, while Grest-Powderville gives GPC resources to continue their philanthropic work, like in the form of land.

Also when Grest-Powderville offered Dr. Grest Powder to be mayor, Dr. Grest Powder responded with *"While I appreciate thy offer, and am truly honored, it is my responsibility to politely decline the job as mayor. I feel like somebody with experience in politics should take the role, as I am not a politician, I am a philanthropist and scientist."*

Grentburg

The only Scireal capital that isn't the biggest city, Grenton is unsuitable for reasons made clear in it's slides. The second biggest city in west Scire, it is by far the most stable influential city in West Scire, it is the second biggest and the capital and is not sheer chaos. Located inland on the Gret River, it has a port that leads downstream through the heart if Grenton out to Lake Axolin.

It is less known than it's sister Grenton but that's a shame because Axolotlia cares way more about it, because it is a Scireal capital and is safe.

It works closely with Grest-Powderville and Scitboro to get resources up the Uxolin past Grenton.

Lockerton

Plorburg

Souþville

Souþville (Southville) is one of the northernmost settlements in the archipelago, and thus its name is a misnomer. It was named when the founders had their map upside down and believed the town was on the southern coast rather than the northern. It has 10 streets all named stupidly similar; Derek Road, Derek Street, Derek Avenue, New Derek Road, East Derek Lane, West Derek Lane, Derrick Road, Derrick Street, Derrick Avenue, and New Derrick Avenue.

The reason is simple, the founders were Derek Smyth, and Derrick Smyth, twins named by very dumb parents, like really, not only are they twins but you gave them nearly identical names? Bro.

This makes Souþville one of the most annoying towns to navigate, for tourists, citizens, and delivery drivers.

Lifeton (MC)

Lifeton is home to the largest lemon farm on Earth and is owned by Life Inc.

Every year, on April 3rd, lemon day occurs, where from the giant spire at the center of Lifeton, Life Inc. shoots lemons at civilians at 50mph. Axolotlia has very little control over Lifeton, so it acts as a mini country.

It has roughly 2,700 people as of 2023.

All citizens are employees of Life Inc. and all buildings are owned by Life Inc..

Citizens of Lifeton are not allowed to leave and live in poverty, and Life Inc. is not communicating with Axoton. All police are blocked from entering Lifeton.

The situation is tense and Lifeton may be shut down in the near future.

Life Inc. commits frequent human rights abuses.

Lifeton pt 2 (MC)

The military raids Lifeton frequently to free neo-slaves, by frequently we mean about once a month, the reason they don't stay in is because Life Inc. has its own military that often pesters the military away leading to battles that needlessly take lives. The neo-slaves can wait a month for rescue to come in at the right time.

The military has been in a siege around the town since 2011, cutting it off from the outside world only allowing lemons and people to leave and food and water to go in, the way Life Inc. gets new neo-slaves in is literally unknown to the Axolotlian Government, some think there is an underground tunnel from the nearby woods.

Before it was conquered by Life Inc. it was a small town of 212 called Grent Riverside Plantations. It’s previous mayor once said “If Lifeton ever breaks free from Life (inc.), it will likely not rename, because it will be a cautionary tale. And renaming is just a hassle, we’d have paperwork!”

Lifeton Border

On all sides, including the two riverfronts, are giant 10-20 ft tall concrete walls with no enterances except one on the land side and one on the meeting point of the two rivers where Lifeton ships lemons, despite that enternace being guarded by a fucking warship and all shipments now being done in ways Axolotlia cannot track anymore.

The walls are many feet thick and have guards mounted on top, alongside the lemoncannons set in the walls along the top on the land border side.

Then from the inside of the wall to the center of town is miles of lemon trees, then we reach the town center, basically a slum, and then the spire.

The raids are conducted by shooting the guards at one area of the wall then going over the wall and storming the town then escaping through an entrance.

Grenton (MC)

Grenton is considered a mini country due to the pure anarchy. Gunfire rings through the barren streets, as gangs fight for control, the City government was shutdown in 2014 when gangs took over, the military prevents people from entering. The city is said to look like apocalypse video games.

There is a military protected hotel near the train station in case the train needs to stop in Grenton for emergency.
The current population of 38,000 (8th biggest city in Axolotlia) is expected to decrease to 30,000 by 2050. It has decreased from a height of 68,000 in 1984.

Abandoned buildings litter the ruined city, People are constantly leaving the city.

It, Grentville, Grentlɛ, Grentburg, are all named after the Grent Sea, named by natives.

Grenton Continued

The Gret River runs straight through Grenton and is protected by the Axolotlian Navy to let goods go from Lake Axolin upstream to Grentburg and into Arada Scire, which has one town on it. The river gets super close to the Gret Sea even though it doesn’t connect to it. A canal was planned to be built in 2016, but, like, city collapse stopped those plans.

The gang warfare and instability makes piracy on the river common, thus the needed naval support.

Located on the western coast of Main Island on the Grent Sea it was a major port city before it collapsed.

Baðr (MC)

Baðr is the final major mini country, not for any seriously bad reasons like before, but simply because they requested autonomy due to their very high percent of native Bræs, request was denied though. As the only settlement on South Bridge Island, and with 8k people, they have the ability to enforce what they want across the whole island and because 98% of the island is native Bræ, they stopped listening to the government until they gain autonomy. They know full well that they are represented in the federal government by Bræ Scire, and the fact that Bræ Scire has the Bræ interests at heart makes their vie for autonomy useless and unproductive.

This is a much less concerning mini country, it isn't a major major city (still 8k is big for Axolotlia) that collapsed into chaos, or a corporate town with thousands of slaves run by a nationwide megacorp, its Baðr, a small city on a separate island with a still working government that is basically just peacefully protesting by illegally not answering the federal government.

History

History Section

This section contains major and some medium events from Axolotlian history in chronological order.

General history is at the beginning, eg name.

Specialized history will be in respective sections, like the history of the Scires are in the Scire section, not history section.

History of the name “Axolotlia”

Axolotlia is clearly named after the axolotl, the Mexican salamander. However, a few axolotls arrived to the islands in 1743. The settlers in the British Colony of Atlantis (The name of Axolotlia while a British colony) named the lake after the axolotls and nicknamed the capital of the colony “Axoton” (formerly Elizabethtown). When the colony of Atlantis gained independence in 1974, axolotls made up such a huge part of its identity, it named itself the Republic of Axolotlia (because the islands were never a part of Atlantis after all, never related to Atlantis in any way).

You will notice that The Colony of Atlantis will rebel against the British multiple times, only being successful twice, the first time is short, strong, and only de facto, the second time is what made the modern Republic of Axolotlia as we know it.

Axolotlia Formation

Axolotlia is a volcanic island, much like Iceland, but in the middle of the north Atlantic. It is even a similar size.

Except Axolotlia is much less active for some reason, the most recent major volcanic eruption was 2016, the most recent major earthquake was 2019, the one before was 2014.

The Norwet Atoll’s formation is unknown, as it is too large and too far north to be an atoll.

🛠️Cræter Lake formation event

Cræter Lake is a supervolcano crater.

Luckily, the last major eruption was about 90,000 years ago, Cræter Lake is said to pose no risk.

How the first natives arrived?

The first natives were from a Native American seafaring empire called The Falantyt Empire, the predecessors to the Fentol Empire (Fentolküa).

They arrived in Axolotlia around 1000 to 1300 CE.

The Falantyters never made it to Europe, and only 5 years after colonizing Axolotlia, they collapsed back home because of unknown reasons.

The colony, now an empire in its own right, expanded across the whole archipelago, but overexpanded for its newness and the Desert Nomads, Bræs, and Lucinians all split off during a civil war, after the war, they became peaceful and the Fentolküa remained the prominent power.

European contact

Columbus found Axolotlia during his first voyage, he knew it was not Asia, so he left relatively quickly and never came back, it wouldn't be until the British found it in 1586 that Axolotlia would start getting colonized.

Columbus did make a few stops at Fentolese ports to restock during his voyages.

Pre-European Era

There were a few native tribes and nations on the islands, the Fentolküa (Fentol Empire) was the largest.

The most well preserved hut from 1636, was built by the Fentolese in the south of modern day West Scire.

It is well hidden and hard to get to, it is not a tourist attraction, that is helping keep it preserved.

It is an 11 hour hike through the woods to get to it.

Languages Before Colonization

By the time the British arrived there was one language in the archipelago, Fentolese, there was always only 1 of course.

It was a dialect continuum, with at least 4 widely accepted major varieties.

Fentol, spoken in the capital and northern parts of the Fentol Empire.

Bræic, spoken on Bræ and the whole Grent Sea coast.

Aradan, spoken in the Arada Desert.

Lucinian, spoken in basically the southern third of the archipelago.

All 4 were mostly mutually intelligible.

Modern Fentolese is based on the Bræic dialect.

Pre European Tribes

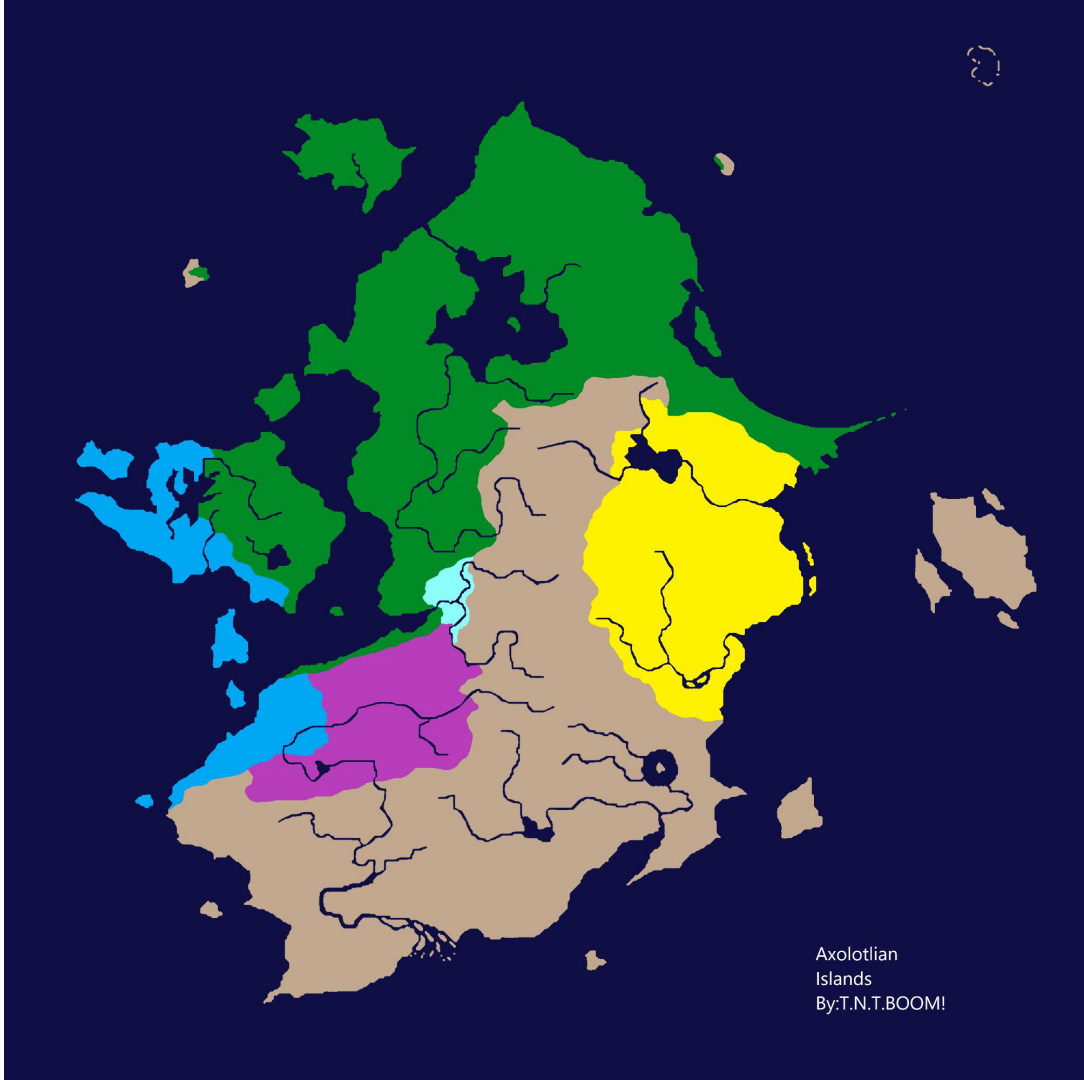
The map is set to the 1650s.

The British have a single outpost where Newlɛ would be.

Green = Fentolküa (Fentol Empire)
Blue = Bræic Kingdom
Purple = Lucinian Tribes
Light Blue = South Fentol Tribe
Yellow = United Desert Nomads
Default = Uninhabited/unknown.

All natives on the islands spoke Fentolese.

Borders are not rigid, and very fuzzy.



Fort Newland Is Constructed by Britain

Fort Newland is the oldest surviving colonial fort and it still stands, it was damaged by wars and rebuilt.

Colonization beginning

In 1652, British colonials (atheist prisoners) start moving to fort Newland, they start fighting the Fentolküa, the Fentolese crush the British at first, before the British return with a military. Pretty soon, the British have grabbed the Fentolese Capital, near where Wellinŋville is today, and the two sign a peace treaty.

The Fentolese migration out of their homelands affected the whole archipelago, and many other wars erupted.

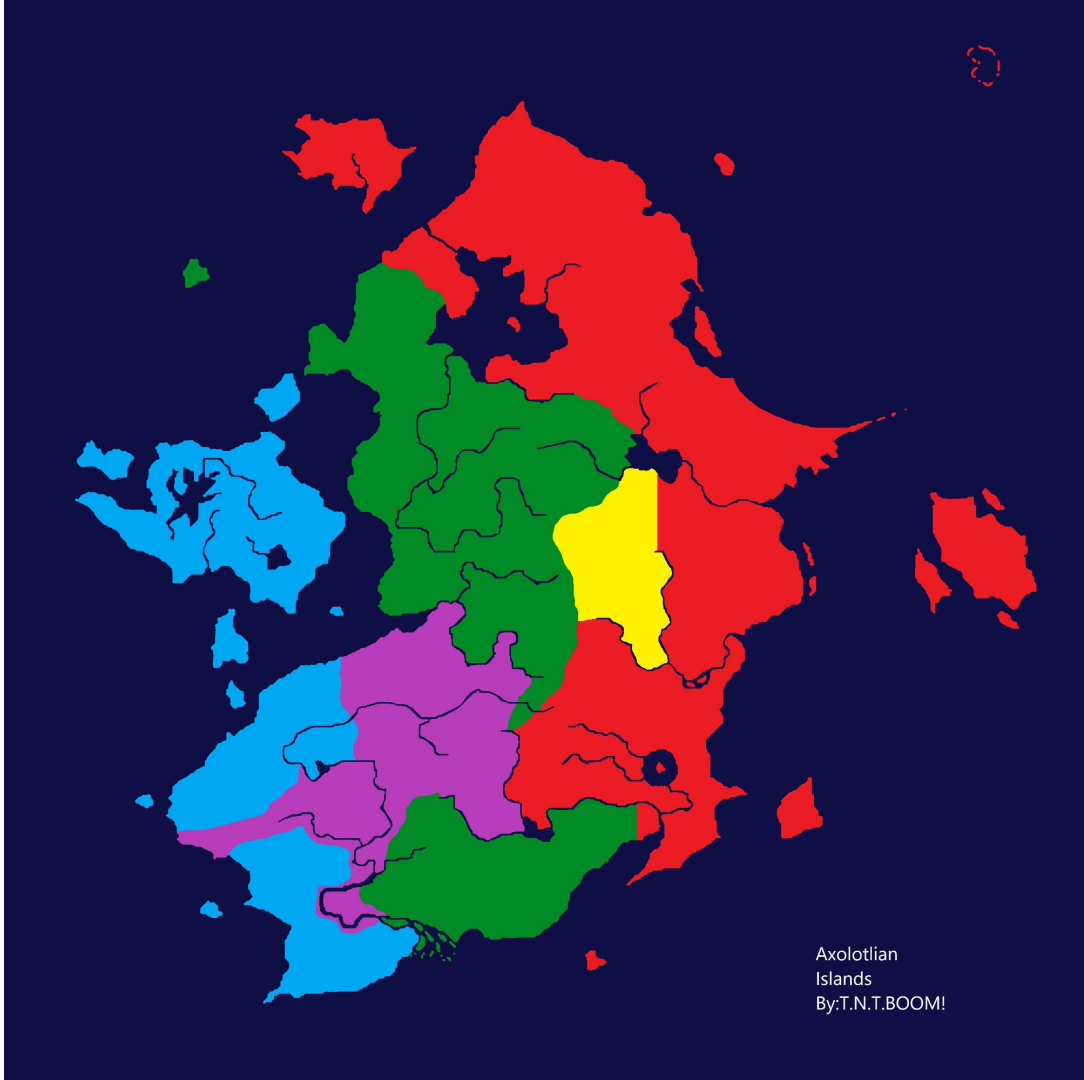
Pre colonization, the islands had about 183,000 native people, post colonization, it was down to about 43,000.

European Arrival

The map is set to 1716.

Red = Britain
Other colors are same as previous map.

When the British Empire invaded the Fentolküa, the Fentolese migrated south, the South Fentol Tribe joined them. Bræic Kingdom invaded their island and parts of the Lucinian Tribes. The Lucinian Tribes invaded as far as they could.
Treaties gave Bræic Kingdom and Fentolküa the southern coast. Nomads got handed their ass by the Fentolküa and the Brits.



British annexation of the islands

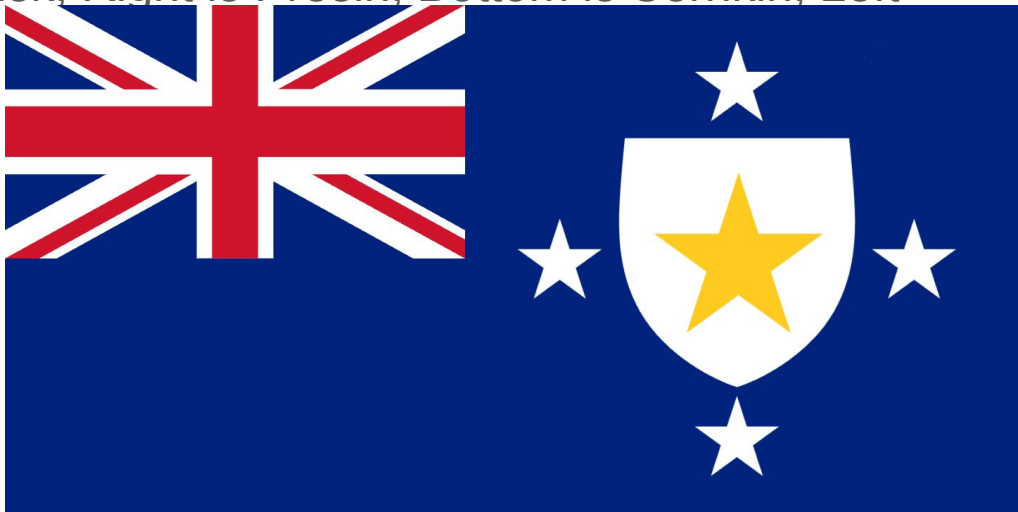
As the British spread across the islands, the natives decided “screw it, if you can't beat ‘em, join ‘em.” So the native tribes united with the Colony of Atlantis as equals in 1755, integrating into the rapidly expanding colony, by 1756, the entire archipelago was united under the Colony of Atlantis, and had a rapidly growing population of about 156,000, with a whopping 78,000 being native.

The Colony of Atlantis

The Colony of Atlantis is what Axolotlia was called while a British colony, and it's flag is below.

The shield represents something something, and the stars are the islands.

Big star is Main Island, Top is Limerwhisk, Right is Presin, Bottom is Sernkin, Left is Bræ



Arrival of axolotls to the islands

Axolotls arrived to the islands in 1743, when a hurricane from New Spain that had crossed Lake Chalco picked up a water-filled hollow tree carrying some axolotls. The axolotls somehow survived the roughly 6,000 mile journey across the Atlantic Ocean, the tree landed in what was at the time Lake Sîrvìdad (Lake Axolin).

One report from a European stupidly fishing on the lake during the storm reported seeing “multiple baby salamanders fell from the storm clouds and struck me vessel, I could tell they were babies because they still had their gills.”

Shortly after, some Spanish colonists from New Spain identified them as axolotls.

The axolotls quickly incorporated into the ecosystems of the island’s lakes and streams by replacing the open niches of the nearly extinct from overfishing dogfish.

14 colonies

Axolotlia was the 14th colony during the US revolutionary war, due to it being separated from the 13 in North America, and being closer to Britain, it was crushed while the 13 succeeded.

The British thought the beginnings of Axolisc (at the time just an accent) was a secret code used by Axolotlian rebels (it was just an accent with no way to encode stuff), so 90% of native speakers were executed (they just wanted an excuse to kill Axolotlians.)

Eventually everyone forgot about the Colony of Atlantis (CoA) being in the Revolutionary War.

If the CoA were to have succeeded, Axolotlia wouldn’t exist today. The world would have been a completely different place, due to the weaker Britain, Stronger USA, and large American North Atlantic island.

Slavery abolition

As soon as the British Empire abolished slavery in 1834, The Colony of Atlantis gave slave owners a week to let every slave free, after that, they hunted down and arrested every remaining slave owner that didn’t know about the new laws, and killed anybody that knew about the new laws that kept slaves.

The CoA took this extremely seriously, as soon as slaves were free, they were given the same rights and treatment as the rest, discrimination was made punishable by death.

There were only 386 slaves on the islands.

North Atlantic Empire of Atlantis

The NAEA was the very first independent Axolotlia, it fought a bloody war for independence from Britain, starting in 1860, it gained de facto independence in 1861, still fighting the British Empire, who still claimed it as the Colony of Atlantis. NAEA had a ruthless racist dictator. Its flag is in the flag section.

It stole all British ships from the waters near Axolotlia, and began rapidly colonizing, it attacked Canada, Greenland, many North Atlantic Islands, Ireland, Morocco, and Northern South America, gaining de facto control of parts of them, while still fighting Britain.

Pretty quickly, other European empires, notably the French, Spanish, and Portuguese, team up with Britain to end the NAEA, which was about at its max extent, and beginning to threaten their colonial ambitions. The Alliance conquered NAEA's capital (Elizabethtown) in 1864. All lands claimed by NAEA were returned to their previous owners. It was a very strange 4 years.

NAEA is why the British ruthlessly kept CoA in line using cruel tactics. They didn't want an independent Axolotlia to do this again.

Map depicting the de facto max extent of NAEA. It only took 2 years for NAEA to grow to this from just the islands.

Axolotlia during the World Wars

The Colony of Atlantis (CoA) played a sizeable part in the World Wars, not only did the Brits use Atlanteans as disposable meat shields in WWII, but the allies in general used CoA as a Mid-Atlantic base.

In WWI, Axolotlians revolted against the British Empire, with hopes of gaining independence, or at least getting invaded by other Allies to get a new colonizer, like the French or Americans, that would hopefully respect the Axolotlian culture, and languages. The British crushed all rebellions and used cultural cleansing tactics to erase anything that made CoA, Axolotlian.

In WWII, CoA again revolted, the British were busy, and all Allies were also busy, so Axolotlia, still got crushed, the Allies wouldn't let the strategic location revolt, then a single division of NAZIs got past Allied defenses and named a cactus “Hitlera Serntala”, the Axolotlian rebellion then destroyed the NAZIs in CoA.

After WWII, Axolotlians would be treated like absolute shit by the British.

Independence

Axolotlia gained independence from the British February 24, 1974, Britain would give independence after 3 full scale revolutions in Elizabethtown (Axoton), New Manchester (Minift), and Lucinia. They quickly renamed the capital to its nickname of Axoton and New Manchester also got renamed a few weeks later.

Immediately after independence, Axolotlia tried to gain alliances with NATO members for protection, notably the USA. Axolotlia was successful in gaining America as an ally.

Britain would continue harassing Axolotlia after independence, and it would seemingly never end.

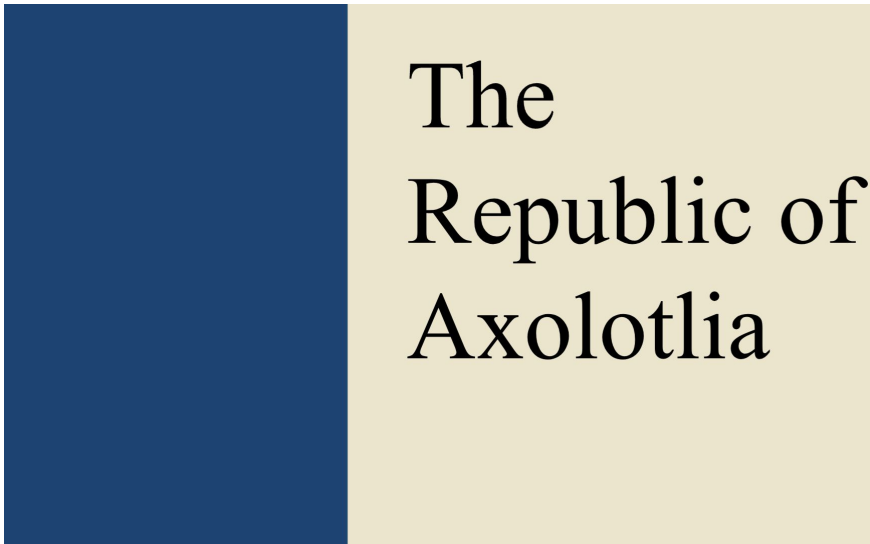
Independence Flag

The flag of the Independence movement and Axolotlia for about 2 months before they created and adopted the current flag (at the time the star had 9 spikes).

Yes that’s Times New Roman, Yes this was an official nation flag of a country for 2 months.

No wonder they changed it.

It had no reason to suck this badly.



1976 pollution scandal

In 1976, a newly independent Axolotlia noticed it had a severe problem, the British empire had been using it as a garbage dump since 1852.

The British tried to get Axolotlia in trouble with the UN for the pollution, everybody believed them. Axolotlia showed proof that the British were the ones who destroyed the Axolotlian environment, everybody switched sides.

Since 1976, 100% of Axolotlia’s environment was restored.

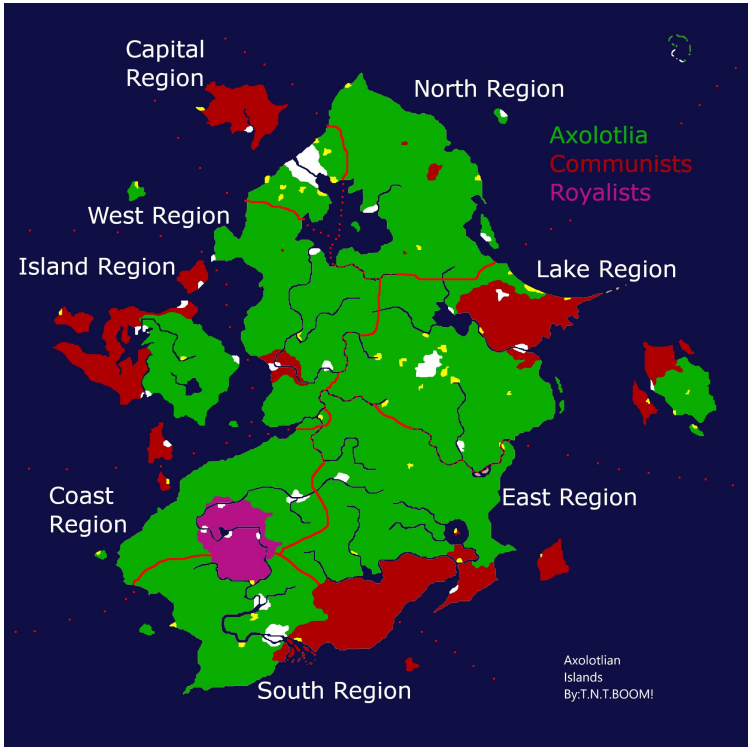
The trash was sent back to Britain, 8 cubic miles of trash.

1982 Axolotlian Civil War

This map shows the Axolotlian Civil War, during the rebellions's peak in summer '82.
The Central Government was backed by the USA and NATO (Excluding the UK, and Canada, reason why later.).
The Communists were backed by the USSR.
The Royalists were backed by the UK.

The Central Government won.
Royalists wanted to reform the British Empire with the UK and Canada.

The two tiny Sterklono islands were not under any control and were pure anarchy.



1984 Civil War Ends

The Central Government over the final year slowly but decisively crushed every enemy army they fought. The Royalists were destroyed first and the last one was crushed in late 1983, but the commies fought until the middle of 1984 when they surrendered. They were pardoned if they agreed to never rebel again, and give up voting rights until 1990.

Ever since then, Axolotlia has grown very unified, with constant struggles only growing it more together.

Life Inc. is founded

Life Incorporated was founded on November 7th, 1991 as Life Gives Thou Lemons Incorporated, after a year it was shortened to Life Incorporated, nowadays often shortened to Life Inc.

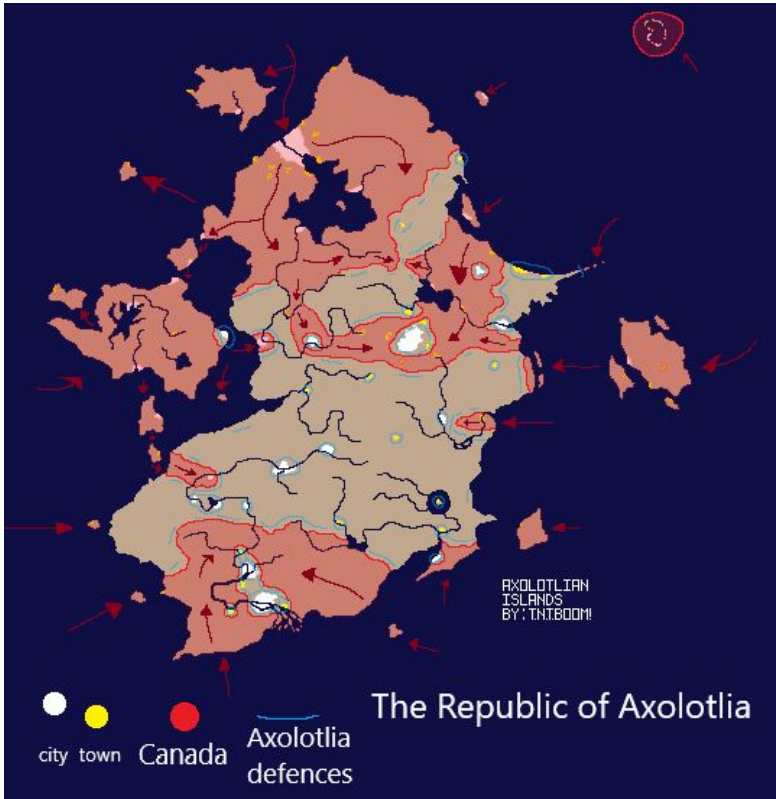
It was founded as a group of friends' lemonade stands who got together to make a lemon based company, they then bought some empty land and started a lemon farm, it snowballed into a very successful farm and company that then went extremely corrupt very fast, and by 2005 it was one of the most corrupt, evil companies on Earth.

1994-1995 Canadian invasion of Axolotlia

On Oct 6, 1994, Canada invaded Axolotlia in an attempt to annex it for its resources, Axolotlia won with 46k deaths, Canada only had 12k deaths. Canada managed to occupy about half of Axolotlia, including all islands not part of the Main Island.

The Canadians committed numerous war crimes against the Axolotlian people, including the public shredding of the Axolotl Statue of Worshipping via office shredder, a large concrete statue of an axolotl face in Axoton, the Axoton ASW is the most significant religious site in Axolotlia. The peace treaty was on May 10, 1995. The Canadian public supported this treaty.

Animated map of the war
https://youtu.be/29UlHrpKNSI?si=5UjPVcrAHLymHuPy



Canadian Invasion More War Crimes

The destruction of the Axoton Axolotl Statue of Worshipping wasn't the only warcrime by destruction of a protected building committed by Canada. They also raided and destroyed the contents of 3 museums to try destroying Axolotlian culture, and even turned one into a fort to use for their military. They tried to raid a 4th but the contents had already been relocated to a safer town. They also blew up Fort Newlɛ.

They had also made worshipping the Axolotl Gods illegal in their occupied zones and repressed speaking Axolisc in public, like the British had been doing during colonial times. Axolisc wasn't even usable as a secret code because it is so mutually intelligible to English in speech.

They also tried poisoning Lake Axolin to kill the axolotls in the lake, luckily it is very hard to poison a lake the size of Rhode Island bad enough to affect the whole thing. Unfortunately the amount of poison they put in at Grest-Powderville did kill hundreds of axolotls and may have killed some people.

Canadian Invasion peace treaty

Immediately after the war ended, on May 10, 1995, a new prime minister was elected, and they were mad that they had invaded, so they wanted to let Axolotlia know they were remorseful. Canada immediately returned all occupied lands, rebuilt all damaged infrastructure for free, and paid Axolotlia 500 billion USD in war reparations. They rebuilt Fort Newlɛ.

Canada insisted that the original 400 billion wasn't enough, which is why they paid 500 billion, they also profusely apologised constantly for years.

They then paid all affected persons 1000 usd.

And they gave Axolotlia some islands that would become a territory called New Canada Territory, it is about 800 miles to the northeast.

Grest Powder Company Founded

On September 2, 2001, Dr. Grest Powder founded the Grest Powder Company with the goal to make the world a better place, since then their job has gotten harder, and their goals bigger, and nowadays they are one of if not the largest company in Axolotlia, and one of the largest on Earth.

2000s rapid growth

After the Canadian Invasion, during the 2000s, Axolotlia entered a time of unusual peace, Britain was not overtly antagonistic yet, Canada had helped Axolotlia rebuild, and Axolotlia had no internal enemies, or external enemies either, it was getting allies with the USA and Europe, and rapidly modernizing and getting richer.

Because of all this stability and development, Axolotlias population skyrocketed and tourism boomed.

Nobody knew that the UK was funding the at-the-time unknown Anti-Axolotlia terrorist organization The Bloody Good Innits for a terrorist cyber attack that would knock out the Axolotlian Government.

2006 Dogfish Rediscovered

In 2006 the dogfish was rediscovered, they were believed to have gone extinct from overfishing after the newly introduced axolotl outcompeted them and spread, but the dogfish has made a comeback and since 2006 have recolonized most streams, rivers, lakes, and ponds in the country, much like the axolotls.

Britain becomes an asshole

In 2009, the UK shifted dramatically towards being outwardly and overtly antagonistic towards Axolotlia and clearly hadn't gotten over Axolotlia’s independence and success.

This was all still there before, it was just ramping up significantly.

2011 temporary government collapse

Between April 4th and April 30th, 2011, Axolotlia experienced a 27-day period without a functioning government as a result of a terrorist cyber attack.

The British Government sponsored terrorist organization “The Bloody Good Innits” (more info in the foreign relations section) sabotaged the Axolotlian Government’s communication network, causing a collapse of communication, leading to the government's temporary shutdown.

During the shutdown, the nation experienced a small recession, prices shot up 6%, and crime rose 1%, government debt went up 22%, an increase of only 56 million dollars, and unemployment rose 1.3%.

When the government came back, everything settled back to pre shutdown levels.

It was one of the largest cyber attacks in history.

Retaliation of 2012

In March of 2012 Axolotlia discovered where the Bloody Good Innits were hiding, in a warehouse in the Arada Desert, so logically, as payback for shutting the fucking government down, the military bombed the warehouse so badly that it was reduced to a smouldering crater and the military stormed the ruins and arrested 68 members, the Bloody Good Innits did fight back but they were outmatched, outgunned, and outnumbered.

21 people died, 19 from the Bloody Good Innits and 2 from the military.

By 2015 the warehouse was rebuilt and the Bloody Good Innits were recruiting.

The 5 leaders as seen on their dedicated slide all escaped the Retaliation and hid in an underground bunker for 2 weeks until things were “safe” for them to return.

2013 NATO membership

Axolotlia joined NATO on September 2, 2013. The only struggle was getting the UK's approval, every single member wanted Axolotlia in, because of Axolotlia's extremely strategic location, but the UK was too busy hating Axolotlia and plotting another cyber attack, bigger than the one in 2011, to care.

It took 3 months of negotiations from every other NATO member and Axolotlia, with the UK, for them to let Axolotlia in.

Just a little over a year later, the world would learn why the UK so badly didn't want Axolotlia in...

2014 Collapse of Grenton’s Government

In January of 2014, the government of the City of Grenton, one of Axolotlia’s largest, fell to the gang warfare that had been plaguing the city for years. This seriously alarmed the Nation, Grenton is a major port city crucial to West Scire and the whole nation, and now it is in anarchy and under the control of gangs.

The Military stepped in to get things under control but the gangs fought so well that they maintained control, instead, the military just cut the city off from the outside world to keep the chaos from spreading and the situation has remained identical ever since, over a decade. There are plans to do something though.

It currently has ~38k people.

2015 Axolotlia-British Cyberwar, First Attack.

Date: February 15-18, 2015.
Damage: ~$64,247,000,000
Deaths: 238 (due to power outages in hospitals)

On February 15th, 2015, Axolotlia went into a massive panic, their communications network was knocked down by another cyber attack. Not only their communications though, all government websites, some major banks, and even critical online infrastructure was targeted, and either damaged or taken offline. Axolotlia scrambled to find the culprit, and soon, they got messages from British citizens that the British government and military did it. In just 8 hours, Axolotlia was crippled, their government and military was unable to act, about half of the country's population (~811,500 people) were without electricity, which sadly killed 238 people in hospitals, and almost a quarter (~405,750 people) had no cell connection as a result of the attack. This first attack caused almost 64.25 billion USD in damages.

2015 Axolotlia-British Cyberwar, Retaliation.

Date: February 28-March 2, 2015.
Damage: ~$26,413,000,000
Deaths: 0

Axolotlia was obviously not going to let the British get away with this, the Axolotlian Government managed to get some of the country's electricity and internet connection back up and running, just enough to retaliate, and with the help of "Anonymous", the global hacker group, Axolotlia punched back. From Feb 28, to March 2, 2015 Axolotlia and Anonymous managed to knock out 5% of the UK's electricity (3,256,000 people, almost exactly 2x Axolotlia's total population at the time), and disabled multiple of the UK's government websites. They failed to take down any cell networks, and unlike in Axolotlia, no deaths occurred. Axolotlia's retaliation caused much less relative damage to the UK, due to the UK's much larger size, Axolotlia dealt only 26 billion dollars in damage, due to the only major hit being the electricity network.

2015 Axolotlia-British Cyberwar, Final Skirmishes.

Date: March 2-March 13, 2015. (11 days)
Damage: ~$5,743,000,000 (~$497,545,000/day, ~$21,632,000/attack, ~23 attacks/day)
Damage ~$3,924,000,000 dealt to Axolotlia. ~$1,549,000,000 dealt to the UK.
Deaths: 3 (2 in Axolotlia, 1 in UK)

Axolotlia and the UK kept launching much smaller cyber attacks for the next 11 days. Axolotlia consistently dealt much less damage throughout the cyberwar due to its much smaller size, and weaker economy, and because it suffered more damage with each British attack, it couldn't retaliate as hard. The first British attack was almost a wipeout blow, which significantly hampered any ability for Axolotlia to retaliate.

Both sides had very little time to react, for example, on just March 5, Axolotlia and The UK sent about 290 cyber attacks, each one dealt an average of $1,200,000 (very small), totaling about $348,000,000, which was a relatively light day.

2015 Axolotlia-British Cyberwar, Total.

Date: February 15-March 13, 2015.
Damage: ~$94,403,000,000 (~$68,171,000,000 to Axolotlia, ~$27,962,000,000 to UK. 2.4-1)
Deaths: 241 (240 Axolotlian, 1 British)

All in all, the 2015 Axolotlia-British Cyberwar was one of, if not the largest cyber conflict in human history. It is the largest war in history that did not involve conventional soldiers or military equipment, and rivals some major conventional wars in terms of cost and deaths.

This war was very short, and left little time for preparations or even planning, was very rapidly evolving, especially during the Final Skirmishes, and both sides scrambled to do anything with the little time they had in between attacks.

It was the costliest war in Axolotlian history, more than the Axolotlian Civil War, Canadian Invasion, and even the World Wars as a British colony.

2016 Eradication of invasive rats

In 2016, the last rat in the archipelago was captured in Walkerton, this was a massive deal, as rats had been in Axolotlia for nearly 2 centuries.

A celebration was held.

Since the program started in 1991, the environment has boomed, since Main island was cleared in 2014, the whole archipelago’s ecosystem has flourished.

2017 British Cyberattack, Presidential Death, And Child Election of President Dean.

In 2017, The UK launched yet another cyberattack, this time, the president died in the attack, so did the Vice President, all Scireal Governors, and a few major mayors, resulting in a complete lack of anything.

Axolotlia was obviously fucking horrified that they lost a good chunk of their government, so they acted fast, nation wide elections where any age could run, Dean, a 10 year old not even from Axolotlia (he's from Maine), ran for president and somehow won with only 34% of the votes (there were so many candidates that 33% was the amount to win), He has won the 2020 election, and will likely win the 2025 election.

Axolotlia failed to retaliate in time and the UK de facto won.

Jesse (Dean's cousin) ran for vice president in 2020 after he met the new minimum age.

2018 trinitrotoluene factory explosion

In March 2018, a large trinitrotoluene factory-warehouse complex a few miles south of Grenton caught fire due to somebody smoking in a restricted area, the fire lit some TNT and it exploded, this cascaded across the whole complex.

The explosion was 1.7 kilotons of TNT, the explosion was heard many miles away.

In nextdoor Grenton, mere miles away, it was as loud as gunshot, nobody reacted because of the commonality of gunshots though.

The factory was obviously reduced to a smouldering crater, it was as if a small nuke had gone off after all.

103 people were killed, all were in or near the warehouse-factory.

Covid in Axolotlia

Axolotlia was one of the first countries to take action, people started wearing masks only a few days after Covid cases were even detected in Axolotlia. Axolotlia was the second Country in NATO to go on lockdown.

Only 76,619 Axolotlians got Covid, and once the vaccine was released, in just a month, 87% of Axolotlians were vaccinated, only 186 Axolotlians died of Covid.

The Grest Powder Company was one of the first companies to start work on a Covid Vaccine.

Axolotlia had one of the lowest Covid rates in the west.

2021 British Threat to Invade

In 2021 the UK publicly threatened to invade, Axolotlia ramped up its military to be ready for war, and the NATO members stationed in Axolotlia also got ready, the UK even sent some jets in the general direction of Axolotlia and the UN condemned the UK. Axolotlia's seaguns were reactivated, something that only occurs during times of war, and Axolotlia began enlisting. It was the most extreme escalation since 2017… it had been just 4 years, and both sides (the UK) were heavily reconsidering this whole relation, they're both western first world wealthy democracies in NATO for crying out loud. So Axolotlia and the UK decided to never threaten each other again (let's be honest it's just the UK, this is very one sided), but they were still very untrusting of each other (Axolotlia didn't trust the UK).

August 12th ASW Bombing

On August 12th 2021, a deranged man named Thomas Tomson bombed the 15ft tall Goldie ASW (Axolotl Statue of Worshipping), the statue had multiple sticks of dynamite drilled into its base, and detonated, the statue almost survived the blast (its a 15ft tall concrete behemoth) unfortunately, the blast caused multiple craters to form across the base and a crack caused the statue to split along the whole length, and it then fell over. The shrapnel also damaged the nearby Wildy statue and multiple other unrelated structures, the explosion blew out a few windows.

Luckily this happened at night and nobody was injured, except Tomas, who went nearly deaf, and was then deported to the UK. Axolotlia concluded the UK government had no involvement. Repairs costed 6,720 Waru (217,996.80 USD).

2022 Werbrid War

In October 2022, 6 of the biggest Werbrid groups in Lucin Scire all coincidentally moved towards Doggerland, the town was on the boundary of all their territories, the groups numbered: 493, 721, 922, 1012, 1472, 2832.

The war lasted nearly 3 months as the groups clashed, screaming at each other as they battled through the small town, pecking each other.

People didn't need to stay inside because the Werbrids only care about each other and don't give a shit about people, or even the town, they just wanted the land.

The town residents did have slight routine changes as many roads were blocked off by groups of Werbrids attacking each other, and there were many sleepless nights.

Kaightlynson v. Completely Ordinary Bobworm

In 2023, Karen Kaightlynson sued a completely ordinary bobworm for “property damage to her carrot plant.” The local court accepted the case purely for amusement. The worm got a lawyer and everything.

Kaightlynson lost and the worm was then used as fishing bait.

Everyone in Axolotlia heard about the case and it became the subject of Axolotlian memes for weeks.

This meme was made after everyone heard the worm became bait.

Axolotlia UK befriending

On May 23rd, 2024, the UK experienced the largest reform in its history, they decided to not be assholes to Axolotlia anymore.

UK were like “Fuck this, lets be friends now” to Axolotlia, because it makes negative sense for them to be enemies in 2024.

Also the UK finally stated they no longer wanted to recolonize Axolotlia.

This made the Bloody Good Innits pissed because the UK instantly stopped all support.

In fact, the UK paid Axolotlia 1 trillion dollars to make up for the centuries of abuse, that was the point where Axolotlia did it's usual thing and became unreasonably trusting towards the UK (it's just too trusting).

September 2024 Fluke River Flood

On September 28th, 2024, a massive colonial beaver dam on the North Fluke River collapsed and sent a massive surge of water downstream towards Fluketon, the wave flooded much of the town and caused extensive damage, washing away multiple bikes and destroying a bridge. The wave continued south towards Fluke Lake where it caused the whole lake to rock back and forth, before the flood continued downstream, washing away the banks of the fluke river with every turn. When the flood reached the meeting of the Fluke and Outlet rivers, it caused the Outlet River to flow backwards for a mile. On tha meeting point is a town called Reginald, Reginald was flooded, luckily not to the extent of Fluketon. The flood finally reached the Fluke Bay where it failed to flood Fluke City as the bay is spread wide enough to dissipate the flood.

The flood caused millions in damage, not billions because Fluketon and Reginald are too small.

Battle of Lifeton, 2025

On Lemon Day 2025, or April 3rd, Lifeton did the usual, shooting high speed lemons at civilians. The military saw this and did a raid of the town, battling through the fields of lemons and lemon trees, rescuing neoslaves, and being bombarded from the Spire by high speed lemons.

Gwen Evette was spotted through the Spire window and the military surrounded the Spire and attempted to break in. However, the Spire unleashed 4 metric tons of lemons, which washed away the siege and a following barrage of lemons from the lemoncannons pushed the now disorganized and lemon covered military out of the town.

Overall, 78 people in total died, 334 slaves rescued, 128 arrests made, and Gwen was spotted for the first time in years.

The Battle of Grenton

On April 22nd, 2024, Axolotlia had pulled troops from Lifeton after the Battle of Lifeton, towards Grenton in preparation for a full scale invasion of the city. On April 28th, 2025, troops flooded in from the outskirts of the city, arresting, or if necessary, killing any gang member that stood in their way. Citizens joined in to out the gangs. 918 gang members were arrested or killed, and the city is currently under martial law.

Foreign Relations

Allies and enemies

Axolotlia is a member of NATO, and wants to join the EU.

It has a rocky history with Canada. Although, Canada is now its ally (Axolotlia even lets Canada station troops).

Russia hates Axolotlia because Axolotlia won't let them build military bases, (its in NATO ffs)

Axolotlia and The UK were arch enemies, they constantly threatened each other. The UK hated Axolotlia, and had tried to kick them out of NATO, they publicly stated they regretted letting Axolotlia join. They also threatened to launch a full scale invasion of Axolotlia in 2021. The rest of NATO states they would've defended Axolotlia in the event of a British invasion.

Foreign views of Axolotlia

NATO calls Axolotlia an “uninvadable sea base”

The USA has called Axolotlia “The most strategic NATO base ever”

Putin has stated that he wants Axolotlia to be a “Russian Hawaii in the Atlantic”

China has called American troops in Axolotlia “American invaders” despite Axolotlia telling China it wants the Americans here.

Average westerners like Axolotlia, it's a popular tourist destination and they like how resilient Axolotlian people are.

The UK had called Axolotlia “The Bl##dy Rubbish Isles”, “A piece of s##t in the Atlantic”, “Pathetic f##ks that wouldn’t survive us”, and “A ##########################”.

Canada has profusely apologised for their invasion.

Foreign views of Axolotlia

Since President Dean was elected, many other nations have not respected Axolotlia, because he is a minor, despite his awesome leadership.

Brazil once said “Axolotlia is not to be trusted, can you trust a 10 year old to run a nation as important as Axolotlia?” upon the publishing of the 2017 emergency election results. And in 2023, they said “We take that back, Axolotlia is doing great.”

Mexico and Axolotlia obviously are closely tied, Axolotlia and Mexico are buddies.

Military

Wayne is the director of Armed Forces and National Security, and he is damn good at it.

The Axolotlian Military is small, but not weak.They bought two of the original “Bath Iron Works” Arleigh Burke class destroyers from the U.S. Navy which was being decommissioned, yet still fully capable at early 1990’s technology. “She still shoots straight, and hits hard.” said Admiral Parrywinkle. They are always at a different port every month, to avoid it being an easy target.

Colonel Eggbert “Thermos” Þurman is proud of the 12 M1 Abrams tanks on permanent loan from the U.S. government.

Military

The Air Force also has hard hitters. A10 “Warthogs” take lead in the skies above. Typically one M1 is paired with one A10 stationed on opposite sides of the island. There are many military bases all across the islands.

As for the Navy with one nuclear sub that no one knows about, because we don’t talk about it, because we don’t own one, and it isn’t armed we promise. There totally isn't any of that because we don't have a nuclear powered sub. We only have our one sweet Arleigh Burke destroyer. There's no sub for any country to be able to find because we don't have one in a secret underground ocean access naval base.

Military Numbers

Axolotlia has:

58,800 personnel.

3000 speedboats with pistols or rifles, 10,000 aquatic drones, 55 big ships (2 Arleigh Burke Destroyer), 3 small helicopter carriers, and 0 nuclear submarines there is none, do not look for a secret base in Norwet Atoll.

30,000 $30 drones, 150 helicopters, 30 fighter jets.

1200 Jeeps, 120 Humvee’s, 200 tanks (12 M1 Abrams), 10 firetanks, and a really fast RC car with a nail at the front to poke stuff, it can tow 9 water bottles!

Only 1 nuke that the United States put there during the Cold War, then forgot about. Only one, we promise, also the USA owns and controls that nuke.

0 nuclear submarines there's no nuclear subs we promise it doesn't exist don't look.

More Military Numbers

Axolotlia spends 2.1% of its GDP on defense meeting NATO’s guidelines, the tiny military at first seems to be showing otherwise or that the money is being wasted, but Axolotlia says “Did thou even look at our seaguns and firetanks? Those aren't cheap, there's no off the shelf parts for a firetank, we designed them for crying out loud.”

Also the seemingly low quality stuff (speedboats with poorly mounted guns, 30$ consumer drones dangling cheap cameras) are refuted by the fact there's a shit ton if them.

Military more

The military assets are spread all over Axolotlia, a targeted attack can't destroy the whole military, Axolotlia is so small and the rails so good that the spread isn't an issue as the whole military can be shipped across to a single location in just 3 days.

Military Base Naming Convention

Military bases have a set naming convention. ###-Re-#

Ex: 13-Br-2 (2nd Naval-Air base in Bræ Scire.)

First numbers: 1=Naval, 2=Army, 3=Air

Scire initials: Ca=Capital, No=North, Ar=Arada, Fu=Fluke, Lu=Lucin, Co=Coast, Br=Bræ, We=West

Last number: only used when there are more than one of that type of base in that Scire. So if there is only 1 Army base in a Scire, it would be 2-Re if there were 2 of them, it would be 2-Re-1 and 2-Re-2. Numbered in order of when built, 2-Re-2 built after 2-Re-1.

Temporary or mobile bases have an extra 0 at the start, like 02-So-6.

Military Bases

Seaguns not shown.

Temporary/mobile bases not shown, like the ones in Grenton to protect the river and railroads. Or the one next to Lifeton to help end Life Inc. and free neoslaves and eventually invade once and for all when the time is right.

A few have been made or upgraded after this map.

Military Bases

Military bases often have nicknames, usually meant to make the base seem weak.

Ex: Fort Pillow

Seaguns

A seagun is a manmade concrete “island” with a massive automatic gun on top. During peacetimes, the guns are turned off, but as soon as Axolotlia ends up at war, the seaguns are powered on and will shoot enemy targets.

They are named the same as naval military bases, but with a 1s instead of just 1, the s is for seagun. (1s-Ca-5)

Axolotlia has 107 seaguns scattered around the islands and even in lakes. Mostly near large coastal cities. (Axoton, Lucinia, Grentville/Grenton, etc.), and strategic waters (like the entrances to the Grent Sea.)

The first seagun was set up just after the Canadian Invasion peace treaty.

They also act as stations for drones and speedboats.

Firetank

The Firetank is a unique weapon, it is a tank, but the cannon is instead a thermite flamethrower capable of shooting thermite up to a mile in clear, non windy conditions. It can ignite an acre in a minute and is capable of melting steel. Axolotlia has 10 of these.

The targeted area will have thermite residue for a long time, and will be burned to a crisp that will take years to recover. Axolotlia plans to only use it as a deterrent to avoid the war crime of using a flamethrower.

For every minute it shoots it usually takes 10 minutes to cool with a maximum of 3 minutes of firing before it gets damaged. But one minute of use can make an area off limits for up to 5 hours.

Foreign Militaries in Axolotlia

As Axolotlia is a member of NATO, and located in one of the most strategic places on Earth, it lets the USA and Europe station almost anything on the islands.

The foreign militaries aren't allowed to build new bases, but they are allowed to use Axolotlia’s current bases.

The powerful foreign militaries in Axolotlia protect Axolotlia, and let Axolotlia get quality protection without needing to spend much on it's own military. Axolotlia even earns money from it, as the foreign militaries must pay Axolotlia to use Axolotlia.

Axolotlia has a “Confiscation Clause” that allows Axolotlia to legally take any and all military assets on its soil if a country is kicked out of Axolotlia’s military bases and the assets aren't evacuated in time.

Military Base Tourism

Certain military bases in Axolotlia can be visited by the public with a guide.
Only specific parts of the base can be visited, and only specific bases can be visited.
The visitors are heavily moderated and always watched.
Tickets cost ɻ15 (486.60 usd).

All visitors are scanned for possible weapons, also phones are taken until the tour ends.

Only adults can enter and they must show a form of ID.

Axoton's major base is less strict and much cheaper, you may even use your phone because the whole thing is already public knowledge, uploading video in it doesn't threaten it because, who would attack it, it's so OP.

Domestic Enemies

The following are enemies of Axolotlia, located in or near Axolotlia, they may be associated with Life Inc. or any other large enemy of Axolotlia, or they may be independent.

These range from actually kinda sorta a minor threat to Axolotlia (Life Inc.), to minor annoyances (Atlantis' Resurgence).

This is not saying Axolotlia needs to worry too much about Life Inc. because Axolotlia can crush Life Inc. when they try anything.

The Bloody Good Innits

The Bloody Good Innits were (maybe still are, uncertain) an anti-Axolotlia terrorist organization, responsible for the 2011 Cyber Attacks and subsequent Temporary Axolotlian Government Shutdown, previously funded by the British government. The group's head leader is named Henry Worthington.

There are 59 group members that Axolotlia knows of.
Although there may be up to 200 total members.
These are the leaders that Axolotlia knows of.

1. Henry Worthington
2. Emily Kensington
3. James Middleton
4. Charlotte Abernathy
5. William Pendle

The Bloody Good Innits 2

The Bloody Good Innits operate out of a warehouse in the Arada Desert, up until it was discovered that the Bloody Good Innits operated there, it was thought that the Bloody Good Innits were based in the UK.

There are no current plans to do anything to the warehouse, as the Bloody Good Innits have recently stopped antagonizing Axolotlia. If they do anything at all against Axolotlia again, the warehouse will be bombed, then invaded by the military, and all members will be arrested, like the Retaliation of 2012.

The cyberattack that shut down the gov has already been balanced out with the Retaliation of 2012.

The Bloody Good Innits Goal & Future

Their goal before the UK and Axolotlia friendship was to help the UK recolonize Axolotlia, as that had been the UK's goal, but after the two nations befriended, everyone looked to the Innits to see what they would do, turns out, they were pissed at the UK, but they had no choice.

So now, nobody really knows their future, they might disband, they might change their goals, they might just become a criminal gang, they might make a YouTube channel podcast gaming group. Nobody knows, and Axolotlia is keeping an eye on them. Most worryingly, they could turn to Life Inc. to help Life Inc somehow, alternatively they could try to rival Life Inc.. Axolotlia has offered The Bloody Good Innits an ultimatum "We will drop all charges and plans to end thou if thou aid us in taking down Life Incorporated." we are yet to get a reply… its been 3 months, like, seriously, that's a damn good deal and they left us on read.

If the Bloody Good Innits Join Life Inc.

If they join Life Inc. they would likely become neoslaves working the fields, Life would not care that they are a talented terrorist organization, they would see a group of guys who can pick lemons for them. Axolotlia has warned them of this fact and that if they get enslaved they would be very valuable to Life Inc. who would stop at nothing to keep them down, making military liberation less likely for them, and that if they were liberated they would be prime targets for Life to reclaim. The fact they have not yet responded makes the government concerned they will join Life Inc. but not concerned that two anti-Axolotlia organizations are teamed up, but concerned for the wellbeing of the Innits if they try to team up.

The Innits working with Life Inc. as equals couldn't matter less to Axolotlia, it would be even less of a big deal than when they were both independent outright anti Axolotlia organizations. Axolotlia handled both as separate for so long. If they unite it would be one enemy instead of 2.

Life Inc.

Info on Life Inc. is already spread out across the project, just go find it, plenty of info is in the Cities section under Lifeton, and the Culture section (next section).

In short Life Inc. is a company that produces lemon products and owns and operates a town called Lifeton, with thousands of Neo-Slaves, and constantly tries to make Lifeton into a separate nation, but they always fail.

Atlantis’ Resurgence

Atlantis’ Resurgence is an Anti-Axolotlia terrorist organization, with an estimated 25 members, who's entire goal is to make the Republic of Axolotlia into an Atlantis-themed monarchy, not the Colony of Atlantis under the British, but instead an independent monarchy named Atlantis, purely because Axolotlia is where Atlantis was located in the stories. They are not very successful.

They operate out of a small ship, they are constantly on the move, but tend to hover around the Northeast and Northwest, just out of Axolotlia’s reach. When the Axolotlian Navy approaches, they tend to book it away, which is why they are mostly ignored by Axolotlia. They're ship is rapidly degrading because they cannot resupply or repair in Axolotlia because they would be arrested, so they will need to find a solution soon, because Axolotlia recently eliminated their drone supply line.

New Bray Kingdom Movement

The New Bray Kingdom Movement wants to get Bræ Island or even the whole Island Scire to be independent like it was during the times of the Bræic Kingdom pre colonization.

This movement is highly unpopular even with the natives still living on Bræ for a few important reasons:

1. Bræ has been an integral part of Axolotlia for centuries dating back to the early days of colonization when Bræic Kingdom willingly joined the colony.
2. The concept of independent Bræ died when the Bræic Kingdom became an integral part of Axolotlia.
3. Nobody wants an independent Bræ, only a whopping ~0.36% of Bræ City residents want it (198 people, also they're only in Bræ City.)

An important thing to note: none of the members are natives, and they seemingly do not care about Bræ in any way, because they misspell Bræ.

Bræ Autonomy Movement

See Baðer in cities and towns, Bræ autonomy movement is a much more successful, peaceful, smaller scale (in terms of goals) version of the New Bray Kingdom Movement that actually knows how to spell Bræ.

Companies

The Grest Powder Company

A company dedicated to advancing science, and also helping stop climate change. It has worked closely with the Axolotlian Government for decades, and has influenced Axolotlia for the better.

It is a non-profit organization that has donated billions to various charities and other places. It is one of the biggest philanthropic organizations on Earth.

In just 2020, it donated 1.89 billion to finding a Covid Vaccine, it only earned 2.2 billion that year.

It helps the government with the Axolotlian Space Program.

The GPC currently has 29 of the world's leading scientists and 800 employees.

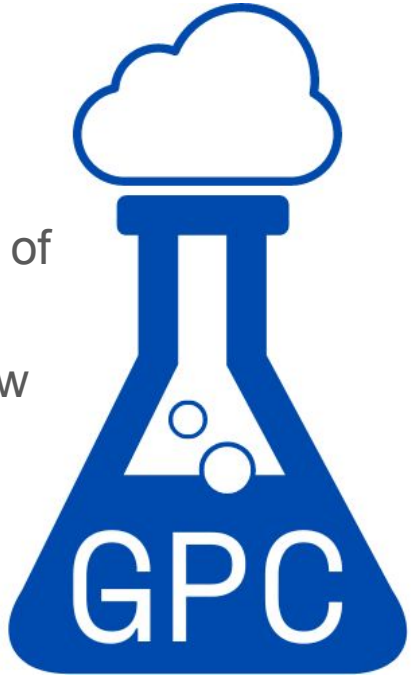
It was founded on September 2, 2001 by Dr. Grest Powder, who is still the owner and CEO. They are headquartered in Grest-Powderville.

The Grest Powder Company

The GPC has its own app and it is one of the most popular in the nation as it allows users to do many things such as buy GPC products, donate to various causes by simply spending money on normal things (like if you buy groceries at the store it donates an extra 0.01 AXW to a good cause).

They recently broke into the consumer electronic market with a line of tablets, GPC Portablet (From Portal, Portable, and Tablet all mixed together) line was first released in 2020 with GPC Portablet 1, a new version is released every now and then with the Portablet 3 Basic and Pro being released in October 2024. (See tech section.)

Logo is as seen, and appears on the backs of Portablets as a light!



Life Inc.

A very greedy company, it only cares about money, it is the owner of the world's largest lemon farm, and Lifeton (all citizens of Lifeton are neo-slaves). They use neoslavery and all employees are neo-slaves.

They have lemon shops all across the nation. They sell lemons, lemon products, lemon merch, and lemon flavored foods. They've tried on multiple occasions to get Lifeton as an independent breakaway Corporatocracy, on every occasion, the Axolotlian military shut it down within a day.

Every now and then, they will show up to random people's homes, and give them truckloads of lemons.

Life Inc. Pt 2

A new Life Inc. store opens somewhere in Axolotlia every week, The police shuts one down every week for neo-slavery. Neo-Slaves are usually paid less than a quarter of minimum wage, and cut from the outside world, if they try anything Life Inc. dislikes, they are severely punished.

“The Axolotlian Government Provided Life Inc. Protection of Former Neo-Slaves Initiative Program” (TAGPLIPoFNSIP) protects neo-slaves that have quit (more info in government section)

It was founded on November 7, 1991.

Life Inc. Public Relations

Their motto is “Life™ Gives Thou Lemons.” (They use “You” internationally). The motto in Axolisc is “Life™ Gefas Þou Lemons.”

Their unofficial motto (they don't like this) is "When Life™ gives thou lemons, it is a legal nightmare to try to sue.” This has never been addressed by Life Inc.

Jingle at end of each commercial: "From tech to treats, feel citrus beats, with Life Inc.'s lemons, life's truly sweet!”

The Jingle in Axolisc: “Fram teck to goodies, fel citrus beats, wiþ Life Inc.'s lemons, life's treoly swete!”

The jingle has been made fun of and negatively parodied to death in Axolotlia for years.

Life Inc. Yet Again

Why is it still in business when it's crimes against humanity are common knowledge? It is the only major lemon supplier in the country and the biggest on Earth. Nobody else can compete. Imports cost way more than Life Inc.’s lemons, and they can export to other less-against-slavery countries. There's a reason Atlantic Taste sold Life Inc. lemonade for so long.

They also make lemon themed tech, recently they released a tablet known popularly (derogatorily) as the Shablet, they also make chargers.

They are a gross monopoly using their power to stay in power.

Logo as shown.

Atlantic Taste

A coffee shop found all across Axolotlia, like Starbucks in the USA. It is the most popular coffee shop in Axolotlia, with a chill, comfy, mom and pop, homely vibe.

When Starbucks and Dunkin' Donuts tried to break into the Axolotlian market, Atlantic Taste out competed them.

Dunkin' had the most success, managing to keep 8 stores open for a year, they closed 6 in 2023, due to low customer counts. Only 2 remain in Axoton. Atlantic Taste has 168 locations across Axolotlia, none can be found outside Axolotlia. Atlantic Taste is highly recommended by most Axolotlians to tourists.

They actually work with Yum Yum, as Yum Yum has Atlantic Taste beverages on their massive menu. Even though the merger failed.

Atlantic Taste

Atlantic Taste recently stopped selling Life Inc. Lemonade at their establishments, over concerns of the public knowledge the lemons are picked by neoslaves, something Life Inc. threatened to boycott and sue the company over. They didn't however because Atlantic Taste is not a small company, and could easily destroy Life Inc. in court.

They took so long to remove it from their menus because there were no other alternatives that could even compare in price.

The logo is as seen.

Yum Yum

Yum Yum is a popular restaurant chain in Axolotlia that sells every type of food you can think of, Chinese, Mexican, Axolotlian, American, British, French, Japanese, Ethiopian, Brazilian, you get it.

Yum Yum has 185 restaurants in Axolotlia and 121 across Europe and North America combined, headquarters are in Grentburg.

Logo is as shown, its… its just “Yum Yum”, in the font Roboto… but bolded.

Yum Yum and Atlantic Taste have talked about merging, but the merger failed due to disagreements over naming and ownership (and deep govt side eyeing). They still work together closely though.

Yum Yum

Harold’s

Harold’s is a supermarket brand seen across Axolotlia. It dominates, and is one of the biggest companies in the nation. Or so it may seem at first glance…

As you can see, there are 2 logos on screen. There are actually 2 different companies called Harold’s, and they split in 1967 in order to better meet local demands, the bottom serves the Arada, Fluke, and Lucin Scires, while the top serves the other 5 Scires.

When combined they are among the 8 biggest companies, comparing to Atlantic Taste and Yum Yum in the food sector.

Unlike Aldi which is in a similar situation, the two Harold’s do not have different legal names. Which is stupid.

BLASTMINE COMPANY

Blastmine Company (stylized in all caps) is Axolotlia’s largest mining company, it produces most of the nations rhodium, Axolotlia has a strangely high abundance of rhodium and it makes up a sizable section of the economy.

Blastmine Company started out as a single blast mine mining iron in 1932, but as it expanded so did it's ecological impact, they realized this and started using other cleaner mining methods, 4 years after switching, surface blast mining was outlawed.

Blastmine Company is now one of the cleanest large scale mining companies on the planet, their largest mine still in use started out as a blast mine and is an truly massive underground cavern carved out by bombs.

BLASTMINE COMPANY

The logo is ass seen.

Grent Riverside Farms

The lemon farming company that owned 56% of the farms in Grent Riverside Plantations before Life Inc. bought all their farmland and the farmland of the others in the town and renamed the town after buying the town.

Grent Riverside Farms remains the second biggest lemon farmer, having used the funds from selling in Grent Riverside Plantations to build new and improved farmland elsewhere, mostly in the town of New Grent Riverside Plantations.

They own about 8% of the nation’s lemon farmland, Life Inc. owns about 87%.

In fact the town they are now based in didn't exist until they relocated there. The town is called New Grent Riverside Plantations because they were forced out of Grent Riverside Plantations and made a new one.

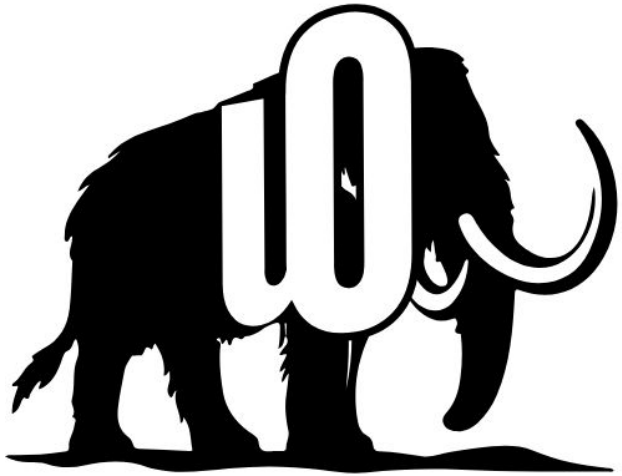
They have replaced Life Inc. when it comes to supplying Axolotlia’s major companies, namely Atlantic Taste and Yum Yum, who recently replaced Life Inc. lemonade.

Grent Riverside Farms Logo

The logo is as seen right here conveniently on this very slide, the slide right after the slide that contains the rest of the info on Grent Riverside Farms.

Unextinction Organization

The Unextinction Organization (UO) is a subsidiary of the Grest Powder Company that is trying to bring extinct animals and plants back from the dead, including neanderthals, which Axolotlia has said would automatically be given full citizenship and a protected status. They successfully brought back the extinct Presin Broadleaf Grass, there are currently 24 of the plant all in an undisclosed conservation facility that they don't want leaked to protect the plants at 54 Riverside Street, Grest-Powderville, the location at 54 Riverside Street in Grest-Powderville is kept secret so nobody can interfere with the research or try to re-extinct the grass.



Websurfer

Axolotlia uses the Websurfer Search search engine on Firefox browser beacuse its one of the few search engines that offers built in Axolisc support, despite being based outside Axolotlia (it's from Norway).

Created in 2009.

Websurfer is relatively barebones, and isn't shoving AI, it was most popular globally in 2016 but fell to just Axolotlia by 2021, now its spiking again as people flee AI.

Axolotlian Technology

Axolotlian Space Program (AXSP)

Best exemplified by https://www.youtube.com/playlist?list=PLwd7DXiZl6AEyyHBTSEsLjUozrG3XFzOI (the program's test sims.)

It is cheap, unprofessional, and basically just for fun, occasionally for valid reasons.

The Axolotlian Space Program made a freaking satellite purely to send anti-Life Inc. propaganda, and also one just to have it do backflips constantly. Only 3% of it's projects even get to space, most launches only get to the upper atmosphere before falling back down.

Recently it has shifted heavily towards Lunar colonization, with no eyes on Mars, all eyes on the Moon, they have crashed a gaming PC into the Moon…

AXSP part 2: Earth’s mini moon.

The Axolotlian Space Program was surprisingly the first to image the near Earth asteroid 56354 Grest, named after Dr. Grest Powder, who was very honored to have an asteroid named after him, everyone just calls it Minimoon and it is possibly gonna be renamed to Minimoon.

After Axolotlia released info on it, and others kept track of it, we learned it was in a mostly stable orbit around Earth, ~2-4x the distance to the Moon.

AXSP has a plan to send a probe to it to collect a sample.

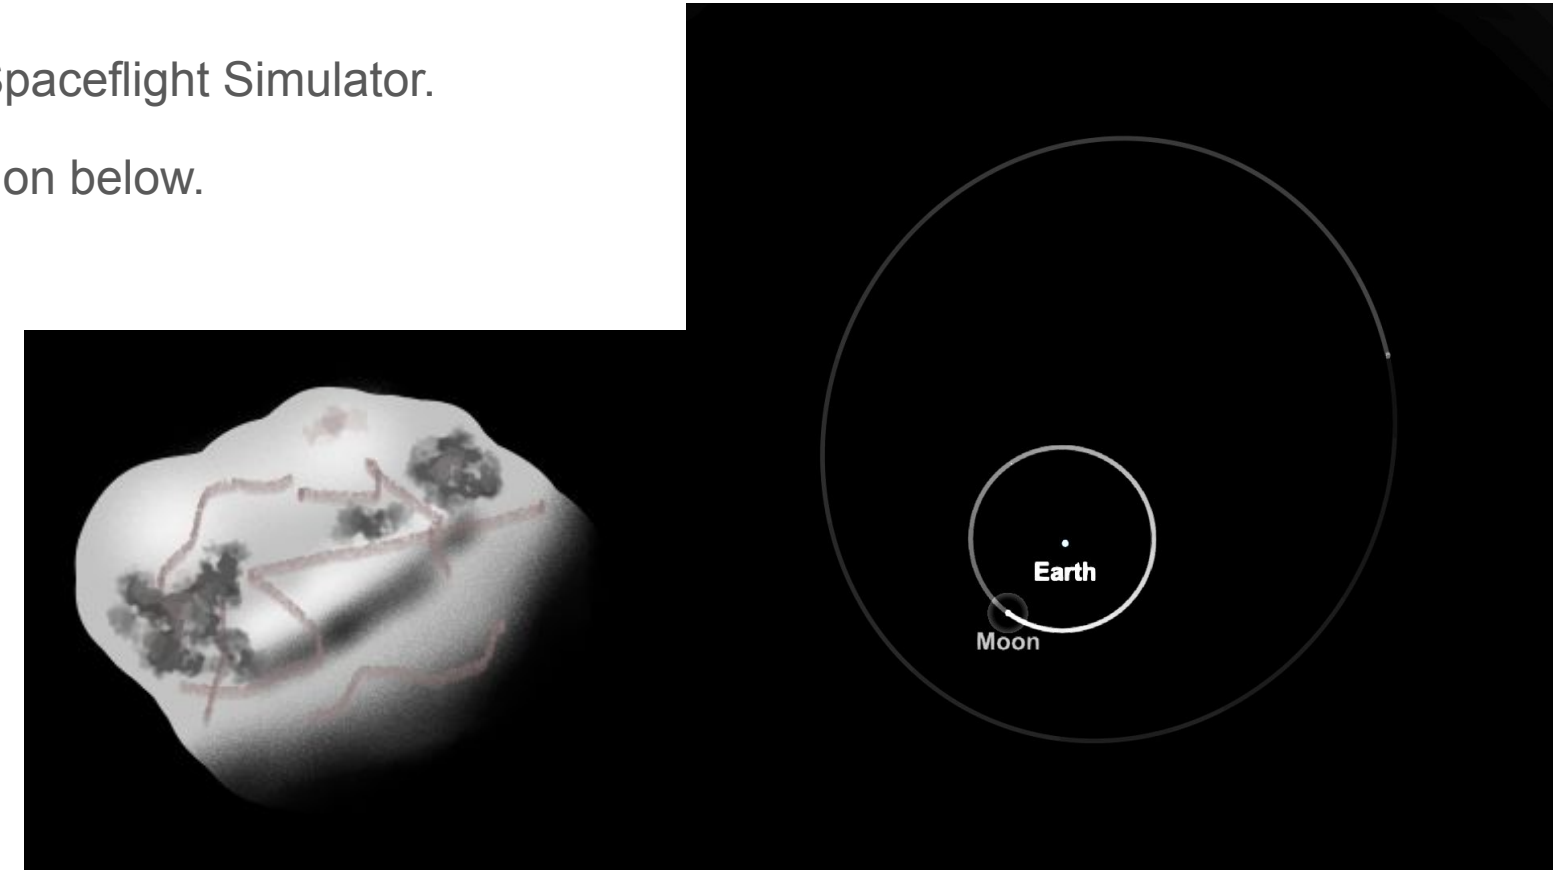
It is predicted to stay in orbit until the late 2200s, it was caught by Earth around late '24 it wasn't seen until recently because it is so damn tiny, about 211 feet wide.

It is in Spaceflight Simulator.

AXSP Earth’s Mini Moon Orbit

Image from Spaceflight Simulator.

Artist's rendition below.



AXSP:Axolotlia’s Over Powered Rocket

Recently, Axolotlia tested a new rocket engine they would use to try sending stuff to space with, they accidentally made it too strong though, as seen in the artist rendition of the photo of the event. That dot in the sky is the sun. It was not dark out. That shows how insanely bright the rocket was, for the afternoon to seem darker than night in the photo. It was so bright spectators said they were temporarily blinded and it was so loud people a mile away felt the ground shake.

World's first green energy airplane

Manufactured by the Grest Powder Company, the first working prototype of the GEJ (Green Energy Jet), GEJ-0 was produced in 2019, and the first one sold to airlines was the GEJ-6 made in 2021.

It can hold 120 passengers and can fly 2500 miles on a single charge, It even charges while flying due to the solar panel wings.

“I’dn’t’ve made it if the climate was fine.” -Dr. Grest Powder.

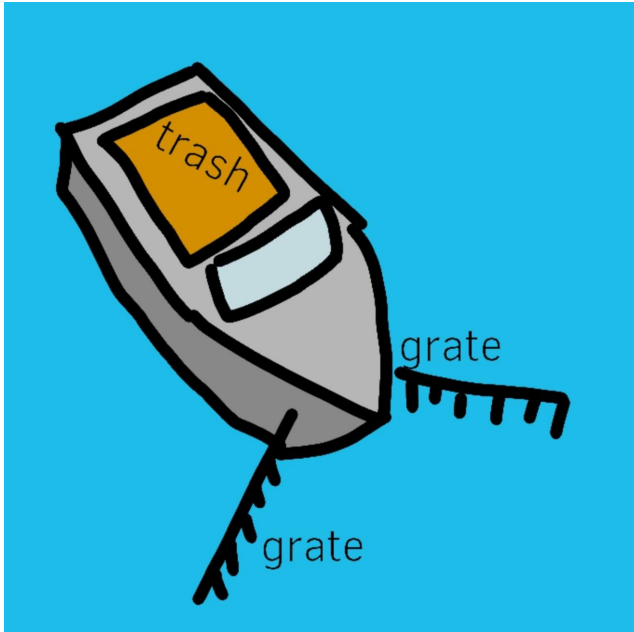
Roboat Seacleaner

Temporary images by Dean.

The Roboat Seacleaner is simply a robotic speedboat with metal grates attached to the front that funnel trash into the central trash collection area. After it detects the trash can is full, it returns to one of the Grest Powder Company's sea testing facility to recharge and empty out. The first version was created in 2022.

'Gif þe bigweþer was acey Ic wyllen not habe madin it." - Dr. Grest Powder.

("If the climate was okay I would not have made it")



Axolotlian Extreme Weather Simulator

Axolotlian Extreme Weather Simulator is a large building capable of holding a 2 story building, and is 2 acres in area, it can simulate up to 10 in of rain per hour, using a grid of varying sized sprinklers on the ceiling. It can also simulate up to 60 mph wind using the fact it is also a giant wind tunnel. It is owned and operated by the National Axolotlian Weather and Geologic Service (NAWGS). It was inspired by NIED in Japan.

It is in Grest-Powderville, and was built by the Grest Powder Company, but it was too expensive for them to keep so they sold it to the government.

It currently has a complex schedule where it flips between tests and recreation.

2 weeks of science and research where companies bid to use it for a week, each weekend it gets bid, and then they have a week to do anything they want, then after the two weeks it opens up to tourism and people can pay to visit it and do their own little experiments in it, it will have varying weather conditions that cycle that people can do tests of their own in, such as test if their new shed will work or not, for example.

GPC Portablet

The GPC has made a line of tables called GPC Portablet (see Grest Powder Company slides). The Portablet runs on Android and has a built in Keyboard, there are 2 variants, one with an Axolisc keyboard, and one with an English keyboard. The Portablet has a 4K screen and the keyboard acts as the cover.

When Dr. Grest Powder announced the GPC Portablet 1, Axolotlia went wild, almost immediately it was being talked about by the likes of The President and Axolotlian Tech YouTubers were talking about it.

Pre-orders reached 100,000 in just a week. People in other countries were pre-ordering (makes sense it is a decent tablet after all, not just Axolotlians care about new interesting quality tablets).

Portablet Specs

The GPC Portablet 3 Basic: 12in, 4k OLED display. 12 hour battery life. 4gb ram and 64gb storage.

The GPC Portablet 3 Pro: has same screen and battery, has 6gb ram and 128gb storage with a built in stylus and the built in keyboard gets a backlight.

It comes in 12 colors and 2 variants, one with an Axolisc Keyboard, one with an English Keyboard. The Basic costs 5.25 waru (170 usd) and the Pro costs 7.50 waru (243 usd). The Portablets are plastic on the back.

The Portablet 1 had a 10in 1080p OLED display, 3gb ram 32gb storage, 10hr battery, the 2 built in keyboard options, but it did have one standout feature, it was dirt cheap. At only 2.60 waru it cost just 84 usd.

Portablet UI

The Portablet is an Android device and comes with a unique Android UI skin that makes it unique.

It in fact the GPC Portablets 2 and onward have a whole store for skins ranging from early 2010s designs to futuristic, retro, 8bit, retrofuturistic, anime, etc, including the ability for users to make and upload their own designs.

Life Inc. LemonGuns

Life Inc. has mounted various lemonguns around Lifeton. There are 3 main types.

Spirecannons: the canons around the top of the Life Inc. HQ they shoot lemons from on Lemon Day.

Squirt Guns: they shoot lemon juice, aka a mild acid, and can make it literally rain acid across the town, often leading to eye pain.

WallGuns: they are mounted on the wall/fence the surrounds the town aimed in and out to prevent slaves from escaping and the military from entering, they clearly only work when stopping slaves from escaping because the military doesn't give a fuck about a few fast lemons.

Lemontank: it's a straight up tank, specifically a PT-76. They have 12 of these.

Life Inc. Tablets

The Life Incorporated Consumer Tablet (LICT), usually derogatorily referred to as the Shablet, is Life Inc.’s consumer tablet, solely made to make money, it is unequivocally dogshit. The fucking thing is a big paperweight, it is also illegal. It collects massive amounts of consumer data and constantly streams a live camera feed to Life Inc, CONSTANTLY. It costs 600 dollars, and is estimated to be made for 58. The hardware would be considered bad in 2008, let alone the 2020s, the screen is dull dark and blurry, the camera is 480p, it has dismal batgery life, cannot get 3g, and also, get this… it fucking uses Android 1.6 Donut, from 2009.

It currently has sold over 4k copies, all of which were tech reviewers and they all gave it dismal ratings. It is somehow still in production and available on Life Inc.’s American website.

Axolotlia’s Superior Dishwashers

All Axolotlian dishwashers come with high powered heating elements to rapidly heat the water, and also they have lots of tech to analyze how clean the dirty water is and also they can aim the water slightly. The detergent release systems are also better.

Most dishwashers in Axolotlia also come with a clear front so you can see what is happening and see how well it is working.

Almost nobody uses detergent pods, they all use the powders.

I was inspired to make this after watching Technology Connections’ video https://youtu.be/jHP942Livy0?si=_IoP2E945ECbwrcF.

Culture

Naming

As you can likely see, names of things in Axolotlia can get very, very long “The Axolotlian Government Provided Life Inc. Protection of Former Neo-Slaves Initiative Program” and “The Dump Truck Full Of Individually Wrapped Slices Of American Cheese Festival” are two examples.

The reason that names get so long in Axolotlia is because of the specificity that Axolotlians like having.

Grent: Half the country named for Grets.

Grenton, Grentburg, Grentlɛ, Grent Isle, Grent Rivers, and Grent Sea all named after the Fentolese word gŕęnt, meaning gret. Also the Gret river and a few as of yet unnamed towns.

Native Name for the Islands

The native name for the Axolotlian Islands is not Æksolɬküa, the name for Axolotlia, because Axolotlia is a modern country, the native name for the islands far predates any Axolotlia, because it predates axolotls in the islands.

It is Mamantoü, or Mamantou, from the Fentolese word mantoü for island.

City Symbols

Every city has a unique symbol that represents it, some are creative, some… arent…

A great one symbolizes the city well, either by showing something unique to it, or a part of its cultural identity, the symbols are used all over the city and can be great tattoos to rep your home. They are prioritized over flags.

The Bræ City one is great, the dot is the city, the first circle is Bræ Scire, the outer circle is Axolotlia, the line is the connection. Lucinia's is a stylized map, great! Abilobotch's is AWFUL, an AB ligature.

Common Axolotlian Sayings

“When someone pats a gret” Meaning: never, because grets don’t like pats. Example: “I’ll do it when someone pats a gret.” Axolotlia version of “when pigs fly.”

“To the enemy, the hilsk goes first” Meaning: always try peace before violence or aggression, A common analogy for Axolotlia’s foreign policy.

“XYZ will become another Grenton” Meaning: the location in question is doing poorly, and will become a horrible place to be if nothing is done to fix the issue. Is hyperbole, I doubt the area will be ravaged by decades of gang warfare.

“They are a Dr. Grest Powder!” Meaning: they are a very good person, similar to “They are a Jesus figure” or “They are like Mother Teresa”.

“F**king grets” Meaning: F**king grets. Usually said after noticing gret poop in their yard. Or when mowing and the poop is found the hard way.

Random

Axolotlia doesn't like cars, it is very walkable and public transport is everywhere and great quality, the few cars that exist (only 32% of people own a vehicle, and only 22% use it weekly) are mostly “microcars” or golf carts, yes, golf carts.

Alliterative poetry is as popular as rhyming poetry because it was common in Old English and Axolotlia likes Old English stuff.

Hydrox is as popular as Oreo in Axolotlia, neither one has endorsed this addition to the project.

Why Axolotlia prefers Hot Cocoa

Axolotlia prefers hot cocoa over coffee or tea. One reason is that in Axolotlia, they despise tea, see history reason why, its because the British were cruel to Axolotlia. They don't like coffee because, hot cocoa is just tastier.

Also in the modern world hot cocoa is easy to get, in fact Axolotlia is the biggest hot cocoa importer in the world.

Music

Axolotlians really like sad songs. Songs about sad but real topics, especially climate change. Seeing as climate change is particularly harmful to Axolotlia.

Every Axolotlian has at least heard the song “Axolotlia Will Be Atlantis” a song about how rising sea levels are expected to flood Lucinia by 2090. And how sea level rise is already harming coastal communities as storms grow stronger.

Another song most Axolotlians have heard is “The New Island” a song about the North Atlantic Garbage Patch. The song was written in 2016 when the North Atlantic Garbage Patch approached Axolotlia and temporarily destroyed the Axolotlian fishing industry.

Fucking Grets (Folk Song)

Fucking grets, oh, Fucking grets, you bastards just always shit.

Shitting in our yards

Pebbledrum

The pebbledrum is an instrument made of a hollow drum filled with metal pegs connected to the drum face, and multiple rocks, when the drum is spun or shaken or moved the rock move around and hit the pegs that makes an interesting sound.

The drum makes different sounds based on how many rocks are in it and their sizes, a common one is to have a bit of many sizes. Also depending on the positioning of the pegs.

Pebbledrums are a unique instrument going far back in Axolotlia’s native history and is a common school project to make one, the students place the pegs how they want, fill the drum with their choice of rocks or other materials, and then annoy the absolute shit out of everyone within earshot as they vigorously shake the shit out of their creation.

Professional pebbledrummers can make some beautiful sounds.

Things to avoid doing in Axolotlia.

Never EVER call Axolotlia “Atlantis” and NEVER call an Axolotlian an “Atlantean”. That is a surefire way to get your ass kicked, because the Colony of Atlantis and British mistreatment is still in living memory.

Never say Axolisc is an English dialect, you will again get your ass kicked.

Don’t mispronounce “Axolotlia” or “Axolotlian”. It’s just a bit rude.

Don't be a Flat Earther or anti-vaxxer, you will be publicly humiliated by everybody, same goes for being a Karen.

Unique Axolotlian National Holidays

These are holidays that are unique to Axolotlia.

Independence Day (February 24): Self explanatory.

Reclamation Day (May 10): The day Canada and Axolotlia sign the treaty. People celebrate the victory against Canada. They also usually celebrate the alliance between the two nations that is helping keep Axolotlia safe.

PJ Day (2nd Wednesday in January): People wear pajamas in public, in 2022, 72% of Axolotlians wore pajamas. The president doesn't wear pjs, even to bed.

Dr. Grest Powder Day (October 22): People recognize Dr. Grest Powder’s achievements and how he has shaped Axolotlia. It is also his birthday!

Remembrance Day (September 1): People remember the Axolotlian soldiers lost.

Festivals and Events

The Dump Truck Full Of Individually Wrapped Slices Of American Cheese Festival (TDTFOIWSOACF) (Axolisc: Þe Dump Truck Ful Ov Alonely Wraped Slives Ov American Cheese Merymeetiŋ): TDTFOIWSOACF is a festival held in Lucinia every year on June 17, very near the peak of Summer heat in Lucinia. The tradition stems from when the USA sent tons of IWSOAC to Axolotlia during the Canadian Invasion of Axolotlia.

Unity Festival: The Unity Festival is held in Axoton, Lucinia, and Minift, on the 1st Tuesday of April, if that happens to be April Fools Day, it is pushed back a week. It celebrates the many unique cultures and traditions found across the islands. The location rotates between the cities, each year, in the aforementioned order.

Festivals and events: Great Snowball War

The Great Snowball War is an event held on Limerwhisk, every year, although it has been getting increasingly difficult to hold due to rising winter temperatures melting any snowfall.

The event is simple, a large group of people mixed with a giant and entertainingly varied field of snow, with few rules on how to play except for have fun and survive. The field is prepared the previous fall, with hills, ditches, and other terrain built for the field to be fun, adult trees are planted and large boulders placed as obstacles/shelter. The construction of the field costs on average a million USD.

It usually lasts 8 hrs, and by the end of the fight, there’s usually hundreds of snow forts.

2023 did not have the event due to a lack of adequate snow, the field had already been constructed, so it was instead used for 2024’s event.

Museums

Axolotlia loves preserving history, most things of even minor historical value are put into museums like the Axoton National History Museum, with artifacts dating to pre-pre-european times.

During the Canadian Invasion, many artifacts were destroyed. So after the invasion, museum security was upped significantly.

Fort Newlɛ is the oldest surviving colonial fort, located on the coast in Newlɛ, it has been turned into a museum dedicated to the very early colonial era of Axolotlia.

Bræ City has 55-164 museums depending on if you count preserved ruins accessible to the public as a museum.

🛠️Sports

Axolotlia uses the word football not soccer.

Each Scire usually has their own sport teams.

The Big One

The Big One (Þe Big One) is a gargantuan car race. 2,294 yardlongs (1,564 miles) long. It is a race that completely goes around the entire country, including across the Norbridge Bridge taking the race around Bræ Island on top of the Main Island. The race can last as long as 26 hours.

This race is held only once every 5 years (started 2015), and if there is a storm at a certain part of the track while the racers are in the area, the race doesn't stop. It is held in fall because the golden orange fall trees look pretty, also the chance there is snow or fog or rain ups the stakes.

Everyone gets the same car, thus the race is pure skill, and randomness.

The Big One course

Starts in Axoton, north to Souþville, after a big stretch to the south there’s &ria, then it comes inland back to Lake Axolin in Welliŋville, stopping by Abilobotch, then Newlɛ, Lockerton, we reach the Arada Desert with Plorburg, then Minift, the jewel of the fucking desert. Then we go south to East Bank, the Wittons, then Fluke City, then back up to Reginald and after a sprint through Deltaton we reach Lucinia, we then abandon the coast and follow the Lucin River through Scink, Þinbusc, Yoseenton, Ikno, Yasceð, Perscon, Williŋ, then we skirt around fucking Lifeton and hit Grentburg, then we skirt around fucking Grenton and hit Scitboro, then Grest-Powderville. We do not go up to Axoton again instead we dash towards Norbridge Bridge, we hit Þaneburg, Grentlɛ, Weeanton, Grentville, Brækwo, Bræ City, Weeanton, Grentlɛ, Þaneburg, the finally back up to Axoton.

Infamous Parts

The Abilobotch Step: the whole town of Abilobotch has a step, there is no way around it, the cars have to jup a curb when they go through Abilobotch.

The Mountain Edge: a mile long sharp curvy area with no guard rail. In the mountains.

Norbridge Bridge: a huge bridge crossing the Norbridge Channel, bridging the gap between Main and Bræ island, it is one of the biggest straightaways in the whole race, and it is used twice, once to Bræ and once fro.

Professional Flicking

Axolotlia has a unique sport called Professional Flicking, yes, flicking. Each Scire has a flicking team, competitions go like this:

There is a long table with a line of 20 increasingly heavy objects, randomly selected each tournament, for example, lego brick to water bottle to bowling ball, each team member then goes down the line, flicking each item with their finger, and then the judge measures the distance the object moved, the player score is a weighted average of all 10 distances, rounded to the nearest tenth inch, heavier objects get more influence. The team score is the average of all player scores.

This is a big sport in Axolotlia, as the national championship often gets up to a quarter of the nation watching, and many people outside the islands.

Grant Darnerson has the top score of all time, with 1ft 3.2in.

Drugs

Axolotlian culture is highly opposed to drugs.

There is a newly discovered drug made from ghostshroom called Ghostshroom Powder upon snorting, the users eyes will cross and slowly close. Whether they're standing or sitting, they'll subconsciously and safely lie down on the floor and sleep for about 5 minutes. The allure of the drug is that those 5 minutes of sleep are about 5 hours in the world of their dreams. They'll dream about what they are “into”. If they like horror, they may wake absolutely traumatized. If they like food they may be a chef or food critic. A person can think hard in advance about the type of dream they want to experience. Like big game hunting, deep sea scuba diving, outer space wars etc.

The drug hijacks the brain’s dream and imagination areas.

Scires

What are Scires?

Scires (Shires) are the subdivisions of Axolotlia, think US states, or Canadian provinces.

Each Scire has a governor, they get elected every 5 years.

There are 8 Scires, Capital Scire, North Scire, Arada Scire, Fluke Scire, Lucin Scire, Coast Scire, Bræ Scire, West Scire.

Above is the official way to list the Scires, it is clockwise starting at Capital, and ending at West.

Scires are subdivided further into districts, akin to US counties, districts are divided into hundreds (towns cities unincorporated, and federally owned areas.

Despite popular belief, there was never a Remote Scire, it's just a folklore myth.

Scire history

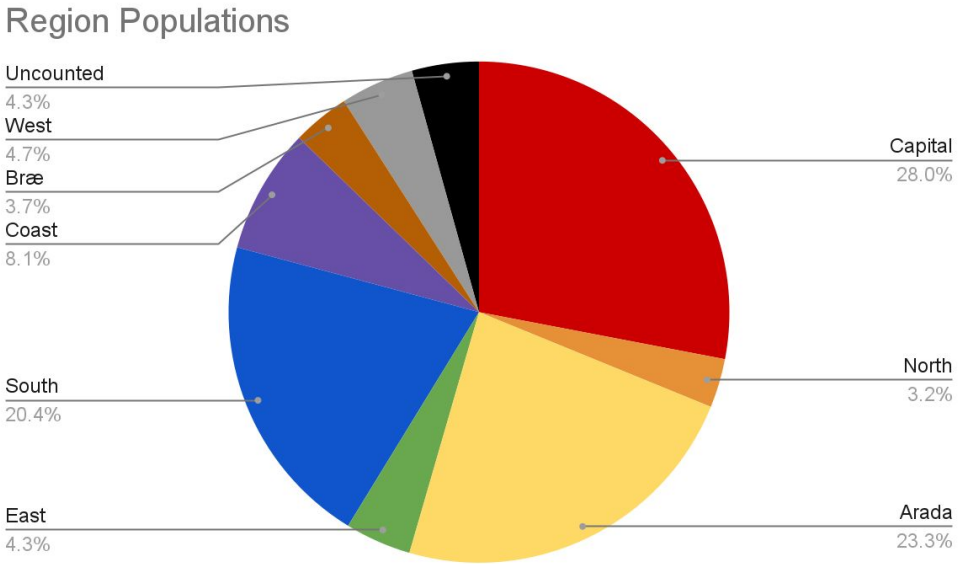
Axolotlia's districts, early precursors to Scires, shifted frequently until NAEA, which had no subdivisions. After the UK reconquered NAEA, it was split into 6 stable districts. Upon independence, these became 9 Scires plus a capital district, similar to other countries with separate capitals. The original Scires were Limerwhisk, North, Lake, Presin, East, Lucin, Coast, Island, and West. Two years later, the capital district merged with Limerwhisk to form Capital Scire, and Presin merged into Lake. Minor border changes followed, including Capital Scire expanding to nearby towns and West gaining land below the Grent Rivers.

Hundreds were set up upon independence and there were 57 of them.

Populations

82k total population is uncounted.

As you can see, the three Scires with the biggest cities make up the majority.



Scire Areas

Capital:

North:

Arada:

Fluke:

Lucin:

Bræ: 3,017.75 square miles

West

Abbreviations

Ca=Capital

No=North

Ar=Arada

Fu=Fluke

Lu=Lucin

Co=Coast

Br=Bræ

We=West

Re=Other

Scires

Each Scire has a capital, the capitals of each Scire are listed below, in no particular order.

Scire	Capital
Capital	Axoton
Arada	Minift
Lucin	Lucinia
Coast	Perscon
Bræ	Bræ City
West	Grentburg
North	Wellinŋville
Fluke	Willinŋ

Districts

There are 30 districts.

The modern districts were created on January 3rd, 2014 to manage the growing population that was getting a bit much for the at-the-time smaller Scireal governments.

Many districts are bigger than Capital Scire in area, despite Capital Scire being more populated than any other Scire.

Districts

All names are officially followed by “District”. Examples: Presin District, Lucinia District.

Lucinia and Minift Districts have been campaigning to expand somewhat. Minift wants to unite with its northern neighbor.

They claim that their borders should be bigger than their city boundaries, and that they should be in the same districts as the small satellite towns that are so dependent on them

Hundreds map

There are 101 hundreds.

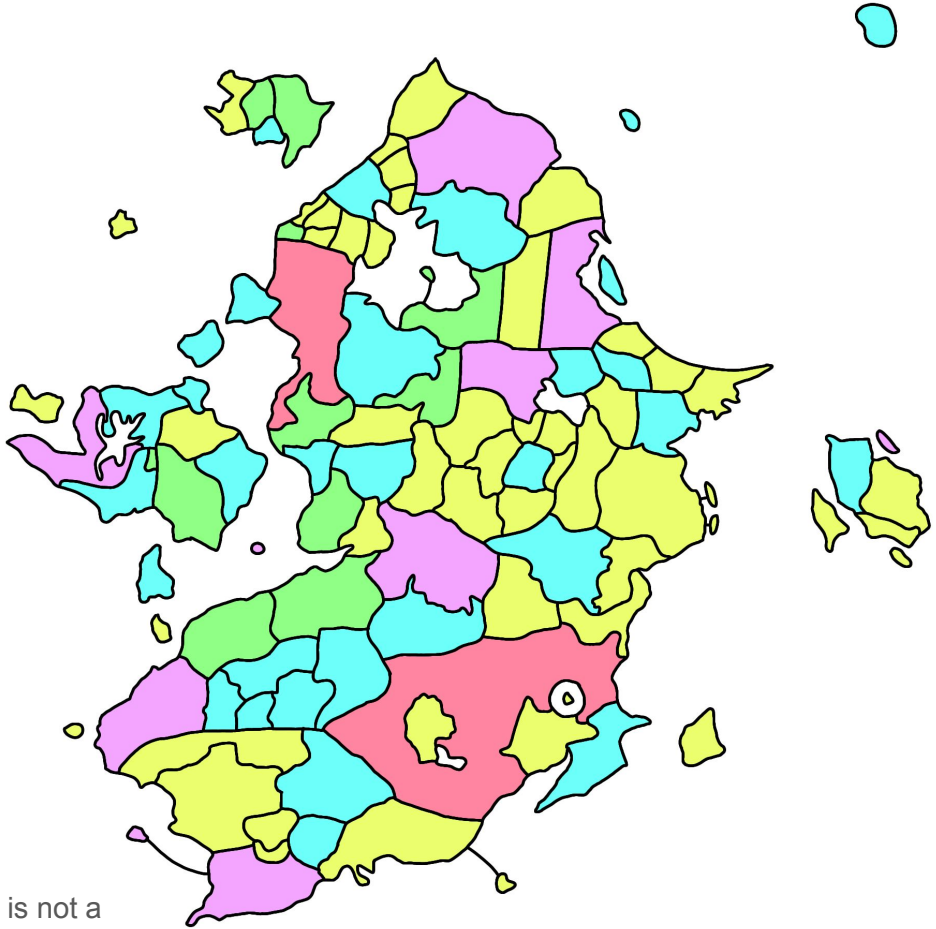
Blue = City

Yellow = Town

Green = Unincorporated Community

Purple = Federally Owned

Red = Scire Owned



I have spotted an error, the westernmost town in Arada is not a town.

Scireal Mottos English

Capital : The heart of power
North : We’re at the top
Arada: Sand is cool
Fluke : Fluke
Lucin : The gateway to the interior
Coast : Do we really need a motto? No. Wait no that’s not our motto, stop writing fuckface, stop fucking writing. Thou better not send that in. Fuck Tho-
Bræ : Second biggest island baby!
West: please send aid, Grenton hasn't had a government for a decade and Lifeton is threatening the nearby areas. (Under review, Grenton is being fixed.)

Scireal Mottos Axolisc

Capital : Þe heort ov strenþ
North : We’re at þe top
Arada: Sɛ is coln
Fluke : Fluke
Lucin : Þe gætweg to þe heortlɛ
Coast : Do we really need a motto? No. Wait no that’s not our motto, stop writing fuckface, stop fucking writing. Thou better not send that in. Fuck Tho-
Bræ : Twoþ bigst ilɛ bæby!
West: please send aid, Grenton hasn't had a government for a decade and Lifeton is threatening the nearby areas. (Under review, Grenton is being fixed.)

Coast and West refused to send Axolisc copies.

Outlying Territories

Outlying Territories are not part of any Scire, but are instead governed directly by the Capital. They usually have a population less than 100, and are on average less than 10 square miles. Axolotlia currently owns 17 territories.

The territories combined have a population of 632.

They are on average 250-500 miles away from the Axolotlian Mainland Islands.

The territories are the remnants of Axolotlia's growth as a colony, as that was the label given to unorganized land not very populated, after independence, the remaining 16 territories were relabeled Outlying Territories. Axolotlia got a new one from Canada during the peace treaty of the 1994-1995 Canadian Invasion.

5 examples on next slide.

Outlying Territories

5 example Outlying Territories.

UT is a small rock 602 miles north of Limerwhisk.
FWIT is 422 miles east of Presin.
WT is 106 miles Southeast of Blont Isle.
NT is 1,112 Miles Southeast of South Scire.
TT is [REDACTED] [REDACTED] of [REDACTED]

Test Territory = TT
([REDACTED] square miles)
Pop: [REDACTED]

Unnamed Territory = UT
(761 square feet / smallest territory)
Pop: 0

List of Territories

Nengar

Antarctic

Wescliand

Frenton and Winkol Islands

New Canada

Unnamed

Test

10 more

Nengar Territory

Nengar Territory is the biggest and most populous territory, thus warranting a slide. The small town of Nengar has most of the 213 people, with 201, it barely makes the 200 population cutoff for town status. The remaining 12 people live in the tourist areas elsewhere. Also the territory is tropical and very popular for Axolotlian tourists wanting a tropical getaway, like Florida is to Americans.

It is Nen-gar not Neng-ar, explaining why it doesn't use Ŋ.

The population is expected to rise.

If the population reaches 5k, they could Become a full Scire. By far the smallest tho.

It is about 12 square miles in area.

Antarctic Territory

Antarctic Territory is ~500 miles southwest of Bouvet Island, just north of 60° south, thus not part of Antarctic Treaty. It was discovered by an Axolotlian explorer in the 1890s and was kept secret from the world by Axolotlia until 1921 when France discovered it, and the Colony of Atlantis flag. Then the British threatened to take it from Axolotlia and make it part of the South Sandwich Islands, but Axolotlia threatened to revolt and the UK was like, “Uuggh, fine. Keep it…” and today it has a military base science research station combo town thing, the population is 35-50 in summer and 5-10 in winter.

Axolotlia likes to brag about it because it is so random, they say “we were a colony, with a colony”. It is the furthest piece of land from the rest of the nation.

It has a tourist hotel called “The Axolotlian Antarctic Inn”. People can see ice.

Antarctic Territory Map

map

Unnamed Territory

One of the public's favorite, solely due to how goofy it is, this tiny rock only 761 square feet in area, has territory status with no people on it, it rightfully should be part of a different territory or Scire but due to the fact there is no other Axolotlian land anywhere in a 500 mile radius, it was decided it is it's own thing. Yes, it truly has no name and "Unnamed Territory" is not referred to by any name in law. It is kind of a placeholder name.

Nowadays it is very useful for expanding Axolotlia's EEZ, even if that is controversial due to the rock's status as a rock and uninhabitability.

There is a lighthouse on it, but it is not manned. The rock is surprisingly resistant to erosion.

New Canada Territory

New Canada Territory, it is about 800 miles to the northeast. It was given to Axolotlia by Canada as an apology for the invasion.

Test Territory

We just wanted to tell you that Test Territory is redacted for a reason, that map is possibly maybe not edited or it is.

Anyways. Yeah…

Don't go looking…

Capital Scire

Capital Scire is named because it is where the capital, Axoton, is. Axoton is also its capital. It has 5 districts and is Axolotlia's smallest Scire geographically.

It has one of if not the largest population almost solely because Axoton is the nation's largest city, and because it is so small but so populous, it has the largest population density in the country.

It has a strong divide between the mainland areas and the island of Limerwhisk, (Axolotlia’s 4th largest island, and also bigger than the mainland area), because the mainland is so highly urbanized and Limerwhisk is so rural.

It has a coast on Lake Axolin, and the Atlantic, and it controls the access to Lake Axolin, and much of the interior because it controls the River Axolin, the only way in and out of Lake Axolin.

North Scire

North Scire is the least populated Scire in Axolotlia, and is very rural. It has many islands, and lots of natural beauty. It is surprisingly wealthy, with not much poverty because of it's tourism, mainly to Norwet Atoll.

It has the northernmost point in Axolotlia excluding territories, being in Norwet Atoll.

It has the longest coast on Lake Axolin, with over half the coastline, and cutting Arada Scire from the lake.

It's capital, Wellinŋville, is on Lake Axolin, and its other 2 largish cities are on islands, the cities of Walkerton and Aunk are on Walker and North Islands respectively.

Arada Scire

Arada Scire is named because it has the vast Arada Desert. It's capital, Minift, also Axolotlia's second largest city, is smack dab in the center of the Arada Desert.

Arada Scire is the second largest in terms of population, mainly thanks to Minift.

Arada Scire owns the big Presin Island, and the smaller nearby islands. All of which are desert and part of the Arada Desert.

It also has the large Lake Flud, which is what it was named after (it was named Lake Scire) up until October 2024, when it and Island Scire were renamed.

Fluke Scire

Fluke Scire is again a small one by population, it has its capital and largest city in Williŋ, on the Lucin River, a river that almost instantly flows out to Coast and then Lucin Scires.

The fact the Lucin River begins in Fluke Scire gives Fluke Scire massive control over Coast and Lucin Scires, because the Lucin is the longest river in Axolotlia and flows into the massive cities of Lucinia (3rd largest), Scink (5th), and Perscon (4th). The river is the bloodline for Coast and Lucin Scires.

Fluke also has 3 lakes, Cræter, Fluke, and Sterklono. The entire Fluke River Delta System is in it, which drains many large rivers into the Fluke River Delta, one of Axolotlia's biggest bays and very noticeable on maps, controlled by Fluke City, Fluke Scire's second largest city.

Lucin Scire

Lucin Scire is the 3rd most populous Scire, because of Lucinia, the 3rd largest city, and Scink, the 5th largest. It is named because it is the southernmost Scire.

Lucinia, the capital of the Scire is on the Lucin River, and split in 3 sections by the River, one on the North bank, one on the South bank, and a section on the Lucin Island between.

It has the mouth of the Lucin river, giving it massive control over Coast Scire and a lot over Fluke Scire, who’s biggest city is at the start of the river, the Lucin River Mouth has many islands in it, collectively called the Lucin River Mouth Islands. It is home to the Derentols, a swampy forest in the south home to a very unique ecosystem.

Coast Scire

Coast Scire, the 4th most populous, much smaller than the big three but about twice that of the next 4. Home to neither the start nor end of the Lucin River, the river cuts right through the center, and most of its population lies on its banks.

It's capital and largest city, Perscon, lies near the start of It's section of the river, and is split in three by a tributary, 4 largish cities can be found going down the river but none nearly as large. Surprisingly, Coast Scire has no towns on the mainland, it's only two are found on its two small islands, and the 5 cities in its mainland are all on the Lucin River.

It has a relatively smooth coast, very long, but not the longest, and a few small islands, 2 big enough to be on the map, to be exact.

Bræ Scire

Bræ Scire is another one that is not the most populous. Its capital and largest city is Bræ City.

Bræ Scire has no land on the main island, entirely located on islands surrounding and including Bræ Island, Axolotlia’s second largest Island. Bræ makes up the vast majority of Bræ Scire. In October 2024, Bræ Scire got renamed from Island Scire.

It has a very unique lake in the middle of Bræ Island called Bræ Lake, this lake is one of the nation's largest, and has no outlets visible on maps, but there are ways the water gets out to the Souþiŋ River, mainly by seeping through a large underground cave system that drains from the south of the lake towards the River, under some specific conditions whirlpools may form on the lake surface.

West Scire

West Scire is an interesting one, not only is it the only Scire whose capital isn't the largest city, Grentville is the capital, and Grenton is the largest city. It has some of the most dangerous places in the country and the safest. 5th most populous and poorest on average.

West Scire has both Grenton, and Lifeton, both are already on other slides. Grenton has a coast on the ocean and on the River Uxolin, which leads to Lake Axolin, which they have a coast on, the Uxolin is a long river that serves Grentville too. Grentville is average and not much smaller than Grenton. West Scire has most of the Uxolin, some goes into Arada Scire, and it makes up a lot of the border between the two. It also has Grest-Powderville, on Lake Axolin shore, home to Dr. Grest Powder, a national hero and the Grest Powder Company, a very important company. West Scire is made up of polar opposites and extremes.

Maps & Geography

Geographical Data

Longest river: Lucin River

Tallest mountain: Mt. Huliak

Largest lake: Lake Axolin

Largest island: Main/Axolotlia Island

Island count: 274, 52 visible on maps.

It is said to be geographically in North America, but politically is closer to Europe.

It has an estimated ~34 billion trees.

Somewhere around 70-80% of the country is forested.

Maps

Base map most others derive from.

1px~0.0348 mi² 22.272 acres.

1px = ~984.06 feet long & wide.

The image is 1000x1000px

Axolotlia in total is 1,156,373 pixels

The image is ~373.0951622 miles across and tall.

Measure stuff yourself.

Islands

Axolotlia Island is sometimes called Main Island, or even just Axolotlia.

There are three “Island groups” that are legally classed together instead of individually, they are Norwet Atoll, Spit Islands, and Lucin River Mouth Islands.

The 4 largest islands make up the vast majority of Axolotlia; Main, Bræ, Presin, and Limerwhisk.

There are (by my count and math) 52 islands visible on this map.

I used Territorial.io to measure the islands' pixel counts.

Islands by size

As you can see, Axolotlia is by far the largest island, making up 86% of the country, If we only take out Axolotlia, Bray still takes up 50% of the chart. For a usable chart, we must remove the 4 largest islands, Axolotlia, Bræ, Presin, and Limerwhisk.

Note: The charts include two island groups as single items, LRMI, and Norwet atoll. Lucin island is not part of LRMI. Norwet Atoll has 9 islands, LRMI has 14.

Maps

Axolotlia’s position in the North Atlantic

The “satellite” map

This map is just an artistic representation of the actual satellite images of Axolotlia.

Without cities for some reason.

Climates

The North of the island (North, Capital, and the north shores of West and Bræ Scires) are very very rainy, and cold, like the United Kingdom. The extreme south is similar to North Carolina in climate. The east is in the Central Axolotlian Mountain rain shadow, and is very very dry and arid, but not hot. Bray has a climate like USA's Pacific Northwest. Still, the majority and average of the climate (the middle) is like New England.

Percents

These are all very rough estimates and likely inaccurate to the reality.

Apparently 15% is desert.

18% is plains.

7% is lakes

And 58% is forests.

1% is high mountain.

Doesn’t include cities which are high.

u/genderdavies helped a lot.

Mt. Huliak

Mt. Huliak is a dormant volcano and the tallest mountain in Axolotlia.

It is climbed by roughly 240 people each year, despite it being discouraged due to its cultural significance, if you litter on it, you can be arrested or fined up to 15.5AXW (502.82 USD)

It is exactly 5,762 feet tall from sea level.

It last erupted in 1351.

It's name means “Volcano of Hu” in Fentolese, as the “liak” suffix means volcano.

Lake Axolin

Arada Desert

The Arada Desert is one of the most unique places on Earth, it’s only there because the Central Mountains are just tall enough to create a rain shadow.

It is a temperate desert, it gets so cold it often snows over in winter, and so hot in summer that streams dry up.

The sand is also unique as it is volcanic sand, it is golden yellow because it is a yellow pumice ash that coated the whole desert.

The flora and fauna have to deal with many clashing extremes, hot summer cold winter, now water at all, and piles of snow, lots of sun, overcast.

Lake Axolin Pumice Rafts

Axolin Island in Lake Axolin has an active volcano named Mount Scæliak (Pronounced like Shayliak) that is notorious for producing pumice, these pumice rafts can be stable enough to stand on and can last months floating around the lake.

One raft that was produced in the December 1999 eruption was 5 square miles and lasted 1 year, a fishing camp was even set up on it, it was officially named Axolin Raft 1999 B, but was nicknamed Big Chunk.

The pumice usually either gets sent to the ocean by the Axolin River or simply sinks to the lakebed, sometimes it washes up and becomes collected.

Grent Isle

Grent Isle has almost no trees, it’s dense forest consists of mostly bushes, very hard to traverse unless you are a small fast animal, like the wild floopsans.

It is illegal to release animals on this island because the ecosystem is so unique, grets carry a 20 year sentence because they will eat all the native life.

It is about 11.55 square miles.

Cræter Lake

Cræter Lake is a giant circular lake with an island in the exact center called Cræter Lake Island, the lake is the caldera of the Cræter Lake Supervolcano, a dormant supervolcano.

The lake is fed by two rivers and the outles is Outlet River.

There is one town on the lake, and it is on Cræter Lake Island.

Galebridge Pit

Galebridge Pit is a pit in Flud District northwest of Lake Flud, opened by an earthquake in 2018, the pit has been spewing gasses for years, and it has been filling with water, the water in the pit is mildly acidic, and swimming is prohibited, it is about 85% of the way to the rim.

Standing near it is difficult due to the sulphur stench.

It is just southeast of the village of Galebridge with 85 people (not on maps).

The plants around the pit have wilted, and it is suspected that if the pit overflows it could become an ecological catastrophe, Flud District plans to install a pump.

It is very circular and has a diameter of 626 feet with an average depth of 120 feet.

Major People

Dr. Grest Powder

Dr. Grest Powder is a national hero, famed for his work in many different fields. He's a badass too.

Due to Grest's recurring nature in the project, info on him is all across the project.

He is a veteran from the 1994-1995 Canadian Invasion of Axolotlia and founder of The Grest Powder Company.

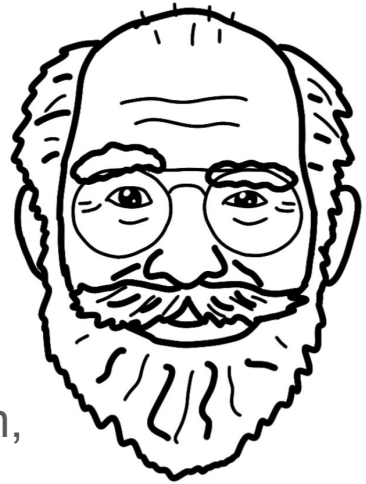
His birthday is October 22nd, 1959, and his IQ is 143.

He really likes Minecraft, Roblox, and watches YouTube. He uses Android Phones, and says the Samsung Galaxy s5 was the best phone he has ever had. (Coincidentally, all of this matches Dean's beliefs. Huh, weird right?)

Dr. Grest Powder 2

He is one of Earth's biggest philanthropists, having donated a total of around 18 billion USD.

He can be overprotective, and unwilling to let go of control in fear that an enemy is trying to sneak into the GPC. A lot of this can be traced back to when a spy blew up his trench in the Canadian Invasion, after he had personally reviewed them before letting them in. This often leads to inefficiency.



"Lifa not for þyself, buta for þoze obutan þou, gif þou lifa for þem, þey wyll lifa for þou." - Dr Grest Powder.

"Live not for yourself, but for those around you, if you live for them, they will live for you." - Dr. Grest Powder (English Translation)

Dr. Grest Powder 3

Grest Powder is actually quite skilled in combat, he was a soldier ffs but like if you tried to beat him up you would likely find yourself in the ER.

Once, he had to defend himself from 6 armed robbers simultaneously with only his feet and one hand (he was carrying a delicious slice of cake to eat while watching YouTube on his tv), he drop kicked the first 2 robbers in the nuts, spun around and threw his hat at the nose of another, breaking it, then he swung around his arm and knocked out the 4th into the 5th grabbing one of their guns that he then threw into the 6th's gun, leaving them unarmed and terrified. They were all then arrested and some had to be taken to the hospital. It was all caught on camera by a security cam and everybody learned not to fucking mess with Dr. Grest Powder.

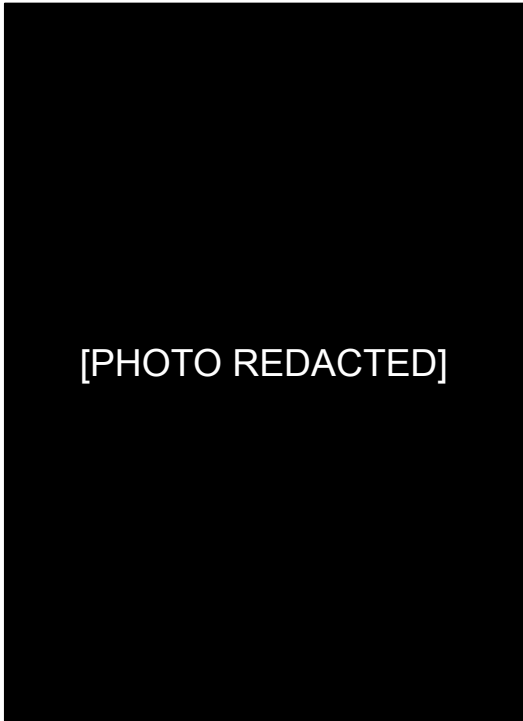
Larryson [REDACTED]

He was a good doctor but after the incident of March 4th, 1995, he was banned from ever setting a foot on the land. His war crimes will never be forgotten and we wait for his descent into Hell. We redact his last name to protect his family, from people who think they are like him.

Larryson [REDACTED] was one of the Axolotlia Defenders in the war against Canada.

Do not ever speak of Larryson [REDACTED].

It is frowned upon to be named Larryson, or to name your child Larryson. If you do, your child will likely get bullied when Larryson is brought up in history class.



Gwen Evette

Gwen Evette is the current owner of Life Inc. she has a net worth of at least 18 billion dollars, and currently resides in the Life Inc. HQ in Lifeton (as far as we know.) There is currently no photo of her because she is in hiding.

When she is eventually captured after Lifeton falls she will be sent to a maximum security prison under construction built specifically for her on north Presin Island called “Gwen Evette’s Resort Prison”.

She will be charged for: Mass Neo-Slavery (x8k+), Treason (x172), Armed Rebellion (x6), Animal Abuse (x4k+), Anticompetitive actions, and also the most heinous… Saying “Axolotlia is a stinky stupid island and I want to personally kill President Dean.” Axolotlia has free speech, so if she just left off the ending bit she would have been fine, for that one charge, because threatening to kill is illegal, even with Axolotlia’s insane free speech.

Gwen Evette

Gwen Evette has a pet gret named Gwet (gwen + gret), despite grets being not pet animals, at all, and usually very uncomfortable as pets, she keeps one anyways. It is rumored she has physically and emotionally abused the poor gret, which is highly illegal in Axolotlia. Nobody is surprised. The gret is said to have fought back and seriously injures Gwen.

She has also ordered the extermination of all animals from Lifeton. A leaked document from her states “I want all non human animals within the wall to be killed. There shall be no animals to distract the employees or to consume the lemons. Particularly the damn lemonbugs and grets, the fucking lemonbugs have lowered profits an estimated 0.3% every year going back to 2014. The only gret in Lifeton shall be my beloved Gwet.” Luckily, bugs are hard to kill and grets repopulate fast, there are no þeran foxes in Lifeton so the grets have no predator.

Gwen Evette

Ew

Tazaŕanzæyʊ̈ Ξazayɬ

Ŧazaŕanzæyʊ̈ Ξazayɬ (English: Taharanhayu Hahayt) is the current Governor of Bræ Scire, he is native Bræ and his first name means Fox King (Ŧazaŕan = Fox, Ξæyʊ̈ = King), so his name means Fox King Hahayt.

He won with 65% of the vote in the 2024 Gubernatorial elections, but his reputation as of the March 1st, 2025, proposal voting day, is BAD, after a series of controversies and scandals, most importantly, having faked being non-native in order to put down his fellow natives to side with racists in the USA to make a ton of money and buy multiple Bræ Scire town governments. His alias was Tarzan, as a nod to the spelling of his Fentolese name, Ŧazaŕan. In short, people want him out of government.

He is gonna test the Axolotlian Government systems in the biggest scandal in years, lets see how it all plays out…

President Dean

President Dean is an autistic 17 year old from Maine who won the 2017 emergency election at age 10, check history section. Since then he has had a prosperous presidency who has profoundly shaped Axolotlia. He is a direct self insert of me, the main writer of Axolotlia, Dean, trait for trait. He is quite central on the political spectrum and supported by most Axolotlians.

He is predicted to win the 2025 election in a landslide and was forced by the public to abolish term limits so that they could vote for him as much as they want.

He loves Minecraft, YouTube, Roblox, Samsung Galaxy s5's. He has 2 pet dogs, Blue, who is older and he is a brat, and Teddee, who is younger, he named her, and she still acts like a puppy, both are bernedoodles.

Wayne

Wayne is the director of Armed Forces and National Security, and he is damn good at it.

President Dean’s Dad.

Folklore

For the sake of folklore

For the sake of the folklore, these stories will be told as they are commonly told, even if there is scientific evidence against them, or they have many variants.

Axolotlism (religion)

Link here: Axolotlian Religion

There are 5 Axolotl Gods, each one controls one aspect of the world, there are dead gods too.

Many customs and more.

This project predates the Axolotlia project itself!

There is a whole section about this religion.

Ssynkumin

The Ssynkumin in Axolotlian folklore is a woman that guides the deceased to the afterlife. When you die, she will appear before you, upon seeing her, you are filled with a sense of peace, she will hold your hand and peacefully guide you to the afterlife, wether that is Æþr or Neþr, you will not know.

She is claimed to be motherly in nature.

The myth of the Ssynkumin dates back to before even the Bræs split from the Fentolküa in pre pre-European times.

The Ssynkumin has appeared in Axolotlian media for centuries and even today she holds a strong role in Axolotlian culture.

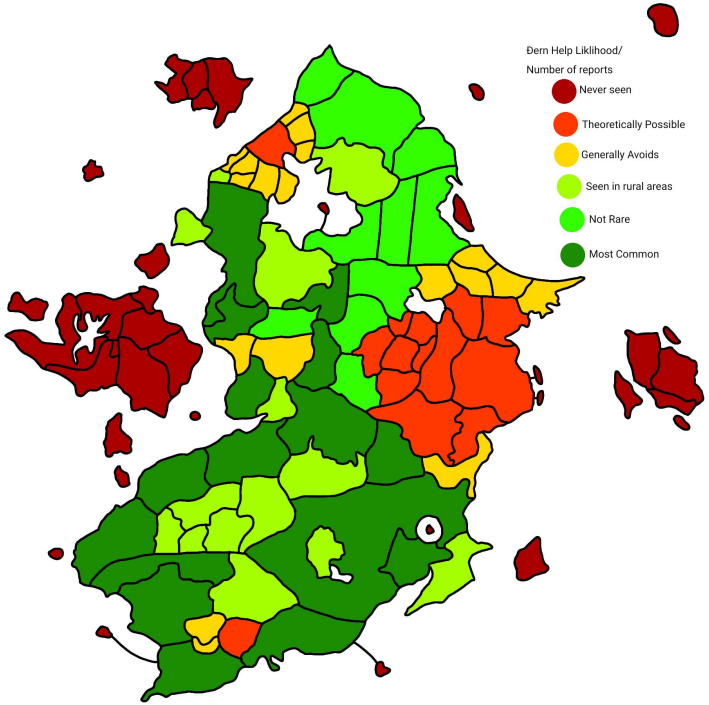
Đern

The Đern is a very popular dude in folklore, he is just a chill fisherman dude, and will help you find your way if you get lost, but you must have a fishing rod with you.

Nobody knows if he is real, this heatmap shows where he has been reported.

Many people who had gotten lost in the Axolotlian wilderness and had a fishing rod claim to have found their way home with the Đern's help.

One guy, William Walker said "I'd gotten meself lost up in the Central Mountains, made meself a rudimentary fishin' rod with a vine and a stick, then the Đern show'd up and led me my way home."



Grentburg Entity

The Grentburg Entity, a photo taken in 1891 shows the Grentburg Entity, an entity found in an abandoned factory in Grentburg. It was not found again after the photo was taken, everybody who goes in that factory disappears.

Police prevent anybody from entering.

The factory is planned to be torn down in 2030.

The photo shows a dark creepy room filled with clutter with a dark almost humanoid silhouette in the corner of the room, it is extremely unnerving and can make people sick by just looking at the image so the image is not on the slideshow for your own wellbeing.

The prevailing theories are 1: Balloon. 2: Mold or Rust patch. 3: Umbrella.

Humanot

The humanot is mythical shape shifting being that can take on many forms, including that of a human, when in human form, it is said to blend in with society and consume innocent people.

It copies human looks but will look off in someway or form.

In the folklore it is said that upon seeing someone who has solid blood red eyes with no pupil or iris, to make no sound and stab it with plastic, the ancient humanot has no immunity to the modern invention of plastic.

Larryson [REDACTED] attempted to create one in his lab in 1993 to dominate the nation, he failed when the beaker spontaneously combusted during synthesis, leaving him with 3rd degree burns all down his arm, and blindness in one eye, turns out he instead made “2,4-Dinitrophenylhydrazine”, a highly explosive chemical, that had instantly exploded. It is safe to say he had failed.

Original idea by Jesse.

Axolotlian drawing of a humanot.

Credit: Jesse

Omnisa Island

Omnisa Island is an island from Axolotlian Folklore said to be moving around the Axolotlian Islands in a perfect circle, it is said to be “A few miles across, unpopulated, and a tropical paradise loaded with gold, and high speed reliable 5g wifi. It also has very delicious mac’n’cheese.”

Most say it’s circular ‘orbit’ is between 450-600 miles from the center of Axolotlia.

The Gret and The Gods

During a particularly long and harsh winter, the Fentolese Empire (the largest native Axolotlian tribe, comparable in power to the Aztecs) prayed to their gods and hoped that the nimberberries would grow. But it was too cold even for the nimberberries, so the Fentolese leader asked a gret to ask the gods to restore normal winter (symbolically, because they knew a lot of science and that they really just had to wait it out). Then, the myth goes that the gret, always wanting more nimberberries, actually went to the gods and shat everywhere, all over the gods' freshly maintained lawn (as grets do). This enraged the gods, who sternly told the gret to stop. The gret then viciously attacked the gods (anticlimactically, of course; it's like a chipmunk attacking an elephant). The gods, mildly frustrated by the mess and slight annoyance of scratches, restored normal winter.

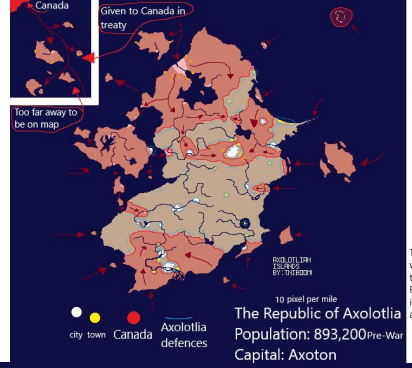
Eclipses

In Axolisc, eclipses are called aspruŋens (asprungen), derived from the Old English word āsprungennes, which means defficiency.

In the native folklore, the eclipse was actually a gigantic gret, shitting on the Sun.

Remote Scire

A map depicting Remote Scire during Canadian Invasion



The 1994 Canadian invasion of Axolotlia, in 1994 Canada invaded Axolotlia in an attempt to annex it for its resources, Axolotlia won with 46k casualties, Canada only had 12k casualties. This map shows Canadas maximum reach.

The entire Remote Region was given to Canada in the treaty. The Remote Region was made of 7 islands that were quite far away.

There is a common theory in Axolotlia that there was at one point 9 Scires with the 9th being called Remote Scire, and after the Canadian Invasion Axolotlia had given the Scire to Canada.

It is suspected the the “Re” Scire initial was created for Remote Scire, and not “Other Scire/Unspecified/More Than One Scire” like how it is used now.

However there was never a Remote Scire, nowhere in the treaty is any land transfers mentioned (except Canada giving to Axolotlia), and the land making up Remote Scire simply does not exist.

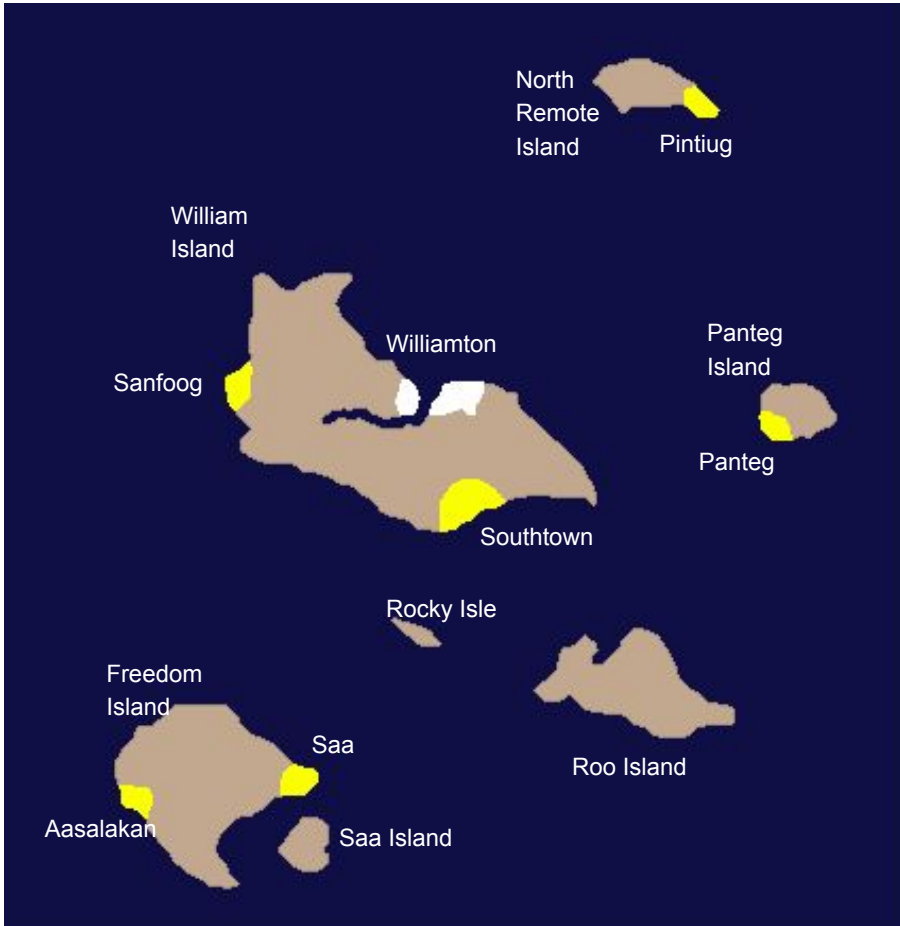
An updated recreation of that map with no invasion

Remote Scire Continued

I was thinking, why not name the things in Remote Scire?

I quite wish I had Remote Scire in the base project.

It would be perfect if I were to make a video game in Axolotlia.



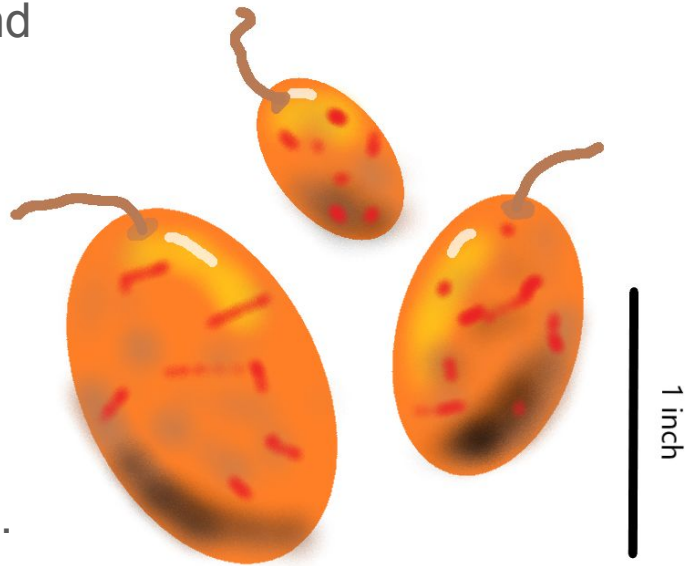
Plants

Nimberberry

The nimberberry is a sweet orange berry with red spots, they only grow in the Central Axolotlian Mountains in the cold. Nimberberries are usually 0.5-1.5 inch in length.

They are famed worldwide for their health benefits, and are occasionally called a superfood. They are often made into jam. They are one of Axolotlia's largest exports.

They are expensive, especially when not in season, and occasionally, criminals try to smuggle them out of the country. Lucky the nimberberry has a powerfully sweet scent that makes police easily catch smugglers.



Nimberberry Flavor

Nimberberry is often described as a mix of blueberry, strawberry, and grape, but even sweeter, and a bit sour, it is thus very good as a jam and flavoring. A common way people make things seem more Axolotlian, often fauxthentically, is by making it nimberberry flavored or by putting nimberberries on it, but because they are expensive, they just blend blueberries, strawberries, grapes, a touch of lemon juice, and sugar to imitate the nimberberry.

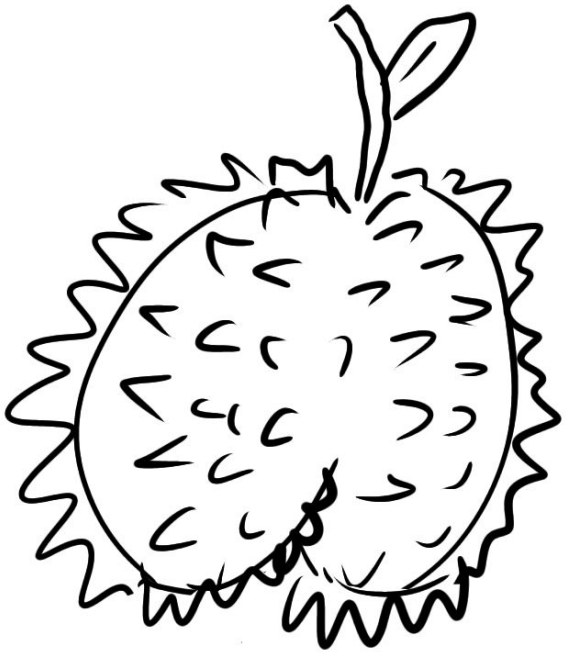
The name derives from the Fentolese word: nibęr meaning orange.

Parelfruit

The parelfruit is a spiky fruit similar in appearance to the durian but more green and kinda peach shaped, closely related to the coconut. Its juice is often added to smoothies, due to it’s “sweet hint of spice”. It mostly grows on the sandy shores of the Lucin Scire.

Do not eat the white seeds inside of the parelfruit, for they are highly toxic. If you eat them, you can die in 10 to 15 minutes without instant medical care.

Due to the toxicity, you usually need a license to buy unprepared parelfruits, and you need a license to sell any food made with parelfruit.



Huliaten

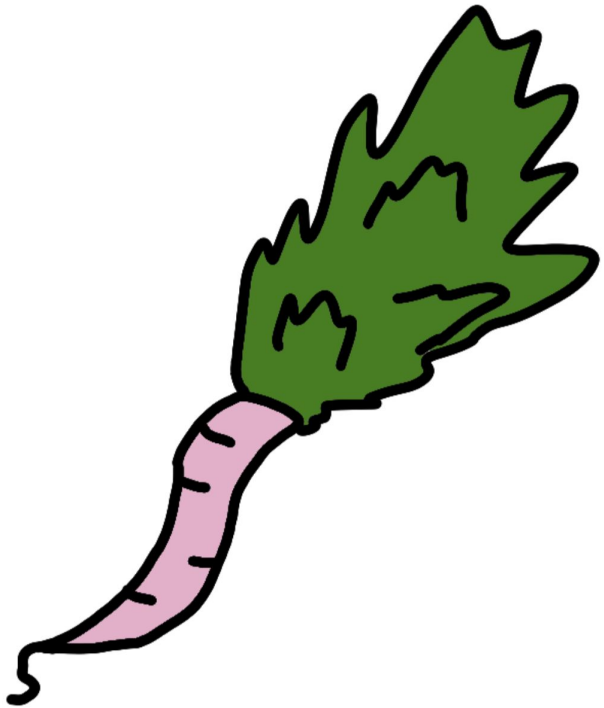
The huliaten is a small, pink root vegetable often used as a spice in many Axolotlian dishes. It is said to taste like a combination of carrot, and onion, and when fried, tastes more like a bell pepper.

Dr. Grest Powder discovered a new type of environmentally friendly pesticide, made from huliaten, called huliaten-34a.

It is in the carrot family.

This image is a clipart of a huliaten.

It’s name is from Fentolese “Ξultai” pronounced “hultai”.

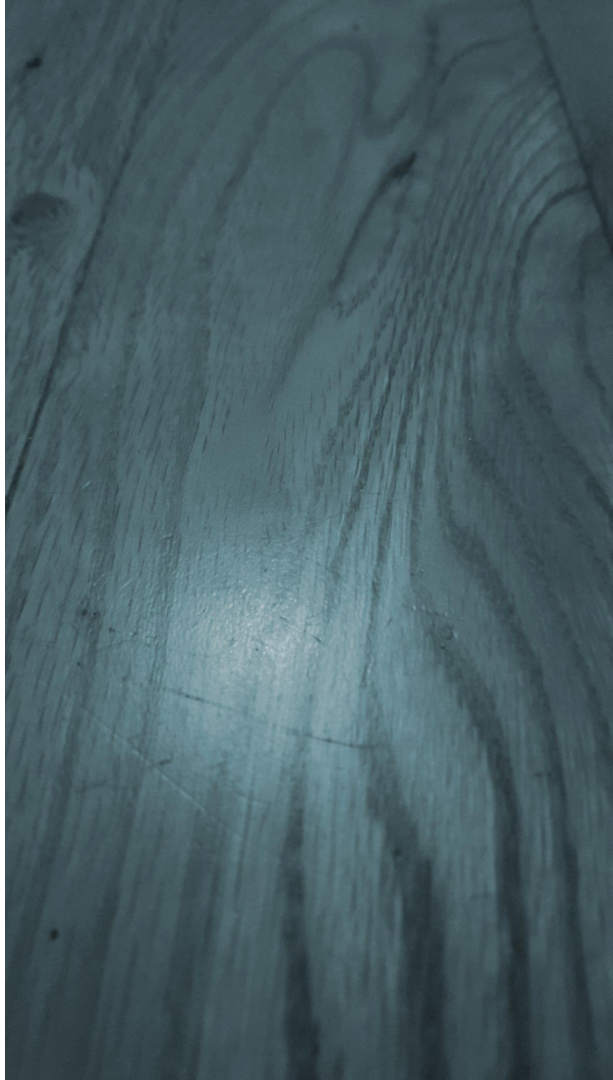


Great Waterwood Tree

The great waterwood tree is a rare type of evergreen tree with bluish wood. People have used it’s blue wood for centuries for its pretty color, not durable though.

This image shows a waterwood floor.

In 2017, Michaelson Sherð started an effort to replant the tree across the whole archipelago, his team (Waterwood Replanting Foundation) has successfully replanted nearly 19,000 trees on Bræ island as of 2023.



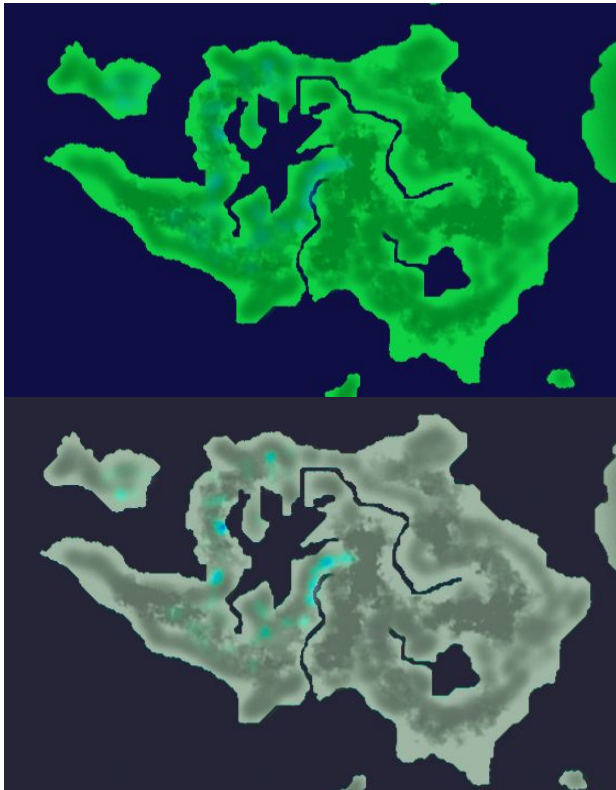
Great Waterwood Tree

These maps show the extent of the waterwood forest on Bræ Island.

It is only found on Bræ Island, however, it used to span the whole archipelago, the blue tinges are visible on the map.

Top: Normal Image showing Bræ island.

Bottom: Blueish areas enhanced to show areas of waterwood forests.



Great Winler Pitcher Plant

Discovered by Margaret Winler, the great Winler pitcher plant is the largest pitcher plant on Earth, measuring 6-12 feet tall, even a small one could consume an adult.

They are mostly found in the humid southern forests, mainly the Derentols.

They mostly eat small to medium animals and birds.

Hitpera Serntala Cactus

The Hitpera Serntala is a relatively small cactus, on average only 3 feet tall, but it’s flowers are massive, about 2-4 feet in diameter. The flower is yellow with a deep blue center, the cactus is usually found in the rocky areas of the desert, and often have Golden Grest Mushrooms nearby.

The cactus was first named in 1943 when a N*zi tried invading Axolotlia, and named it Hit*era Serntala, in 1957 the Government changed the l to a p.

Please-Forget-Me

The please-forget-me is a flower related to the forget-me-not, but the flowers are green, so they blend in, and they smell like flour, and they are everywhere. They are incredibly boring, have nothing going for them, and the name is the most interesting thing about them. They aren’t even romantic, and Axolotlians do as the name says and indeed often forget them.

Blue outline in image is camera error, they look even worse IRL.

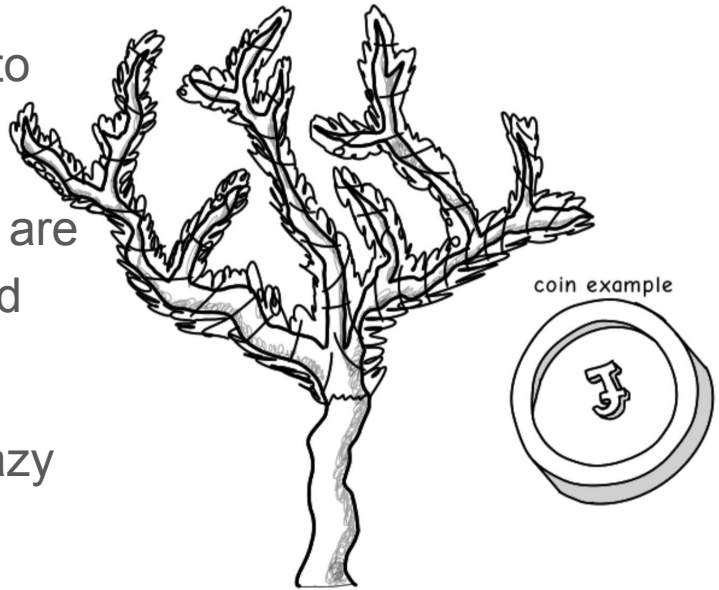
Junudertypatree

Junudertypatree is an extremely rare type of tree that is actually the source of the waru's symbol (ɟ), back in the early 1800s the Colony of Atlantis was running out of the British money reserves, so they asked the UK to send some more and if they could use the Junudertypatree to make temporary money while the shipment arrived.

The Junudertypatree is critically endangered, only 184 are left in the wild and the few in captivity are all in labs and under extreme protection, we won't give any photos.

'Twas named by Johanna Samanberg, she was very lazy and tired when discovered in 1712, it only grows on Norwet Atoll. It comes from the original name "Just another type of tree".

Sketch by Dean, sketched from a description of a photo in 2024



Flunt Pepper

The flunt pepper is a pepper originally farmed by the native Fentol Tribe, it is mild, and tastes very good, it is usually used as a seasoning, or added to smoothies to add a bit of heat. It also has a sweet touch due to selective breeding.

It is tiny, about the size and shape of a carolina reaper, but instead of bright red, it is more of a dark deep rich maroon. Also wrinkly. It gives off an appearance if a super hot spicy pepper high in scovilles, but is mild and quite sweet, easily popped in the mouth as a spicy treat. Due to this, many are at first shocked when they see someone casually eat one, leading to a good prank.

Its name comes from the Fentolese word “flɔnt” pronounced like “flount”

Susæni Susæni

Susæni Susæni, commonly known as ground creeping vine, is a vine native to Axolotlia, it spreads rapidly and kept in check by grets and floopsans, if it isn't kept in check it is very difficult to remove due to its rapid spread and ability to climb trees, if it were introduced to an ecosystem outside Axolotlia it could choke out and cover an area and become a second kudzu invasion.

It is thick and reminiscent of strangler vine, but no branches, or leaves, the vine itself does photosynthesis.

Luckily it is very delicious and when fried is a good source of fiber, how convenient.

People know not to farm it outside Axolotlia though because it is very hard to contain.

Atlantic Corn

This is a high amylose variety of corn common in the North Atlantic and particularly Axolotlia with a protein that functions like gluten, it has been used to make wheat-style bread for thousands of years. In Axolotlia, Atlantic Corn Bread is used slightly more than wheat bread, including for things like sandwiches, and other bread related things.

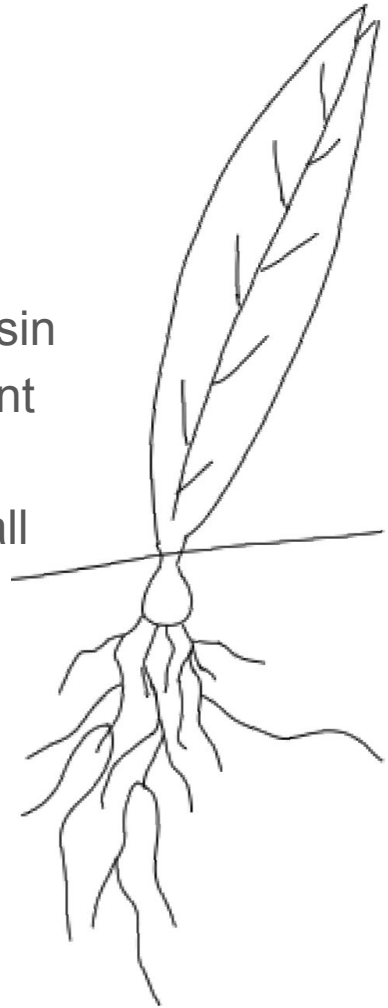
Corn is THE staple food of Axolotlia, and has been for a millennium, the ancestor of Atlantic Corn was brought over when the Falantyters of North America migrated to Axolotlia as the first people to step foot on the island.

See cuisine section for the slide on Atlantic Corn Bread.

Presin Broadleaf Grass

Presin Broadleaf grass is a plant that had been extinct for over 34 thousand years but was recently brought back from extinction by the Unextinction Organization in 2024. It inhabited Presin Island before Presin Island experienced extreme desertification starting 47k years ago, it went extinct 2k years ago, and it is planned to replant it across Presin to help the island combat Climate Change. There are currently 24 of the plant all in an undisclosed conservation facility.

The first plant was interviewed and asked questions like “What is it like knowing thou’re the first of your species in over thirty thousand years?” The plant didn't respond because grass can't talk, and everyone made memes about the interview and the interviewer claims to have thought someone would talk for the grass.



Mile Grass

Mile Grass is a unique species of grass that is super tall, like 30 feet tall, but unlike bamboo, the blades are surprisingly not very rigid and they often collapse and form an elevated mat of grass sturdy enough to support small animals.

The South Williŋ Mega Mat is the area of 12.3 acres and sturdy enough in some places to walk on. Exploring the terrain of a Mile Grass Mat is a very unique experience and encouraged for those who like to explore (and respect local environments.)

Dhoŋji

The dhoŋji is a cucurbit native to the Derentol forest, it is edible and had been farmed by the Lucinians for hundreds of years. It tastes like a gourd and looks like a yellow cucumber. It has a popular secondary “recreational” use as well. The name comes from Fentolese “ŧongiflok” which loosely means “Fruit full of water”

Animals

Gret

The gret (Mustela gret) is a small creature found everywhere but the Arada desert, they can often be seen eating nimberberries, and pooping in your yard.

They are in the mustelinae family, with ferrets, weasels, and polecats. They're roughly the size and proportions of a raccoon, with a body shape not as tubular as ferrets.

They are attracted to the smell of freshly cut grass. They make for bad pets due to their tendency to attack people when they are stressed. They are highly territorial creatures and will attack people if they get too close.

There are an estimated 8 million grets. They are omnivores. They are the second national animal. Their main predator is the þeran fox.

The name comes from the Fentolese word gŕęnt, look familiar? (Grent)

Gret

Grets, unlike most mustelids (which are carnivores), are omnivores, eating plants, such as nimberberries, and susæni susæni, as well as many other plants, they also eat mushrooms. But they also eat insects, and they will grab fish and wouldn’t think twice about eggs, they also eat wild floopsans, black chipmunks, and crabs.

They will get into your trash and eat that too.

But they will choose nimberberries over anything else because they instinctively know that nimberberries are extremely nutritional, a good sign that it is a superfood, given they would choose a few nimberberries over almost anything.

They kinda are Axolotlia’s equivalent to the raccoon.

Hilsk

Hilsks are sand lizards that have very doglike faces, they are very playful and can be hard to catch due to their puppylike energy levels, if you see one you are considered lucky in the native mythology.

They are found in the eastern deserts of the islands, they hibernate.

Hilsks are used as helpers in therapy for people who are allergic to dogs, Dr. Grest Powder figured out that they are comforting when stressed, due to their puppylike behavior.

They are the third national animal.

It comes from the Fentolese word Ξyɬsk or zyɬsk, pronounced the same as modern hilsk

Bræ Wooly Cow

The wooly cow is a common domesticated farm animal in Axolotlia, mostly farmed on Bræ Island. It's wool is very warm and has been used for winter clothing for almost 1,000 years.

It's wool is comparable to sheep wool in durability, but is silkier and softer, less itchy and less likely to shrink in the wash.

It's wool is highly prized around the world, which brings the Axolotlian economy millions per year, in the USA alone, Bræ wooly cow wool can sell for up to 50x the price of sheep wool, mostly due to its rarity, and difficulty to be perfectly replicated.

The Bræ Wooly Cow isn't an easy meal for most predators, only large packs of þeran foxes often even stand a chance of success. Wooly cows are large and strong, capable of tanking tons if damage and easily beating as many as 5 þeran foxes.

Werbrid

The werbrid is a unique type of ratite that migrated to the Axolotlian archipelago thousands of years ago, they then evolved to fit the unique environment of Axolotlia. They have been a delicacy for hundreds of years. They are about 3-4 feet tall and weighs on average 54 lbs. Their call is just screaming.

They were used by Dr. Grest Powder in 1995 to help the Axolotlian Military in defending Axoton from the Canadian geese (RIP Werbrid Werbridson klled by Goose Gooseson). They can be found in the central Mountains, and the Derentol Forest located damn near the southern coast.

They are very territorial and have organized groups that fight over land, literal Werbrid wars, these groups get as big as a thousand and frontlines can span miles.They move to the coasts in fall, often around October.

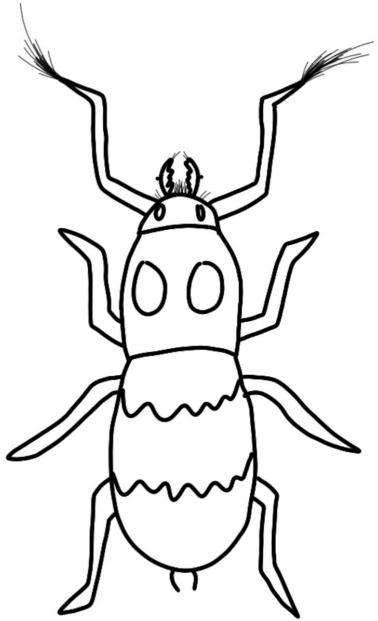
Lemonbug

The Lemonbug is a large insect that eats lemons, ruining the crop without harming the tree itself, it is a nuisance for lemon farmers in the Axolotlian countryside.

They are native to Axolotlia and benefit the ecosystem, but the lemon farmers have been severely damaging the lemonbug's ability to reproduce by using pesticide, harming the forests overall. Mostly Life Inc. does this of course.

It's front pair of legs are actually antennae, making it look like 8!

Life Inc. has tried to make them extinct, but that is illegal (you can't just kill an entire species ffs) so Axolotlia sends the police to protect the insects. Life Inc. ever the fucking assholes, uses their neoslaves to kill the bugs.



Axolotlian Axolotl

The Axolotlian axolotl (Ambystoma Atlantic) is a unique species of axolotl found in all lakes, streams, rivers, and ponds across Axolotlia. They can breath seawater and crawl on land when it is raining, allowing them to reach every body of water on the islands.

It has more gills than the Mexican axolotl, usually 8 total, and is on average, more intelligent, due to its more complex brain, they are very playful and make great pets. Their 8 gills are also longer than the Mexican axolotl, and their legs are stronger.

They are often more energetic than the Mexican axolotl, and can often accidentally harm themselves by playing roughly.

There is an estimated million of them in the wild.

Axolotlian Axolotl 2

Why did Axolotlian axolotls evolve the ability to go on land in the rain, essentially undoing their aquatic evolution that abandoned terrestrial adulthood but in a worse way? Because Axolotlia has a ton of stuff on land that axolotls can take advantage of, like refuge from predators, and food sources not seen underwater, and more places to go. Axolotlian axolotls are notoriously curious and might just like going on land in the rain.

It is adorable to watch, because they are so cute on land, little clumsy buddies. Also they are still evolving, just since 1970, researchers have noticed Axolotlian axolotls have been able to go on land with less rain than 1970, and they might be able to go during just fog by 2040, they have also gotten stronger legs since then too.

Axolotlian axolotl features

These are the notable features of the Axolotlian axolotl different from Mexican axolotls.

8 gills instead of 6, the gills are longer as well, allowing more oxygen flow with less water, like during rain, also allowing seawater breathing. Their legs are stronger as well, allowing rudimentary land movement. Their brains are bigger and more complex, allowing for a more playful behavior, curiosity, and land movement, they are quite smart and can do problem solving much better than most amphibians. They also have had their teeth regrow because, land. They have however lost a good amount of their regenerative abilities, the tradeoff of going on land. They also evolved eyelids, that add to the cuteness and keep their eyes wet, guess when, that's right, on land.

As you can see, almost all differences are because land movement, something only possible because of the stupid amount of rain seen in Axolotlia.

Ornal

The ornal is a highly venomous predatory snail that is closely related to cone snails, but on land. One sting has enough venom to kill 68 to 70 people. It is carnivorous and will attack and eat anything it sees, usually targeting insects like lemonbugs and worms like the bobworm.

Derox

The derox (Odocoileus vulpis) is a deer species that has certain physical characteristics of the red fox, it has a fox-like personality and occasionally will yell out for a mate.

They are the size of white tail deer and evolved from them after a rafting event thousands of years ago, don't ask how, like the Werbrids we have no clue.

Axolotlians have been farming derox for centuries, their milk is comparable to cow or goat milk, and their meat is like deer meat, wild derox is unfarmable.

“When thou find a derox, let it do it’s thing, if thou approach it, it will call all deroxes in the area, and they will harass thou, yes, that kind of harassment. They assume anything near them is a mate.” - Dr. Grest Powder.

Long Leg Crocodile

The Long leg Crocodile is known to chase people for up to 2 miles in an attempt to eat them, it can reach up to 26 miles per hour, and can reach 18 feet in length.

They are highly intelligent and have an amazing sense of smell. The best way to prevent being a meal, is to climb the nearest tree, and call animal control.

Dr. Grest Powder was nearly killed by one of these, he survived by stabbing it in the head with a cheap plastic spoon.

They are native to the Derentol Forest Swamp in the south of the island with its southern Maine environment, the Derentols are about 200 sqmi in area.

Great Brown Gorilla

Bigfoot was an escaped Great Brown Gorilla. The Axolotlian Government formally apologized for not noticing the GBG that got on a container ship in 1952.

Bigfoot was formally returned to Axolotlia in 2018 in a big ceremony, Bigfoot died in 2021 in the Axoton Zoo.

GBGs are notoriously hard to photograph due to their extremely shy nature.

Conspiracy Theorists claim that Bigfoot was not returned, and many think he wasn't even a GBG.

They can live up to 120 years.

Floopsans

Floopsans are a group of 3 closely related species of rodents found across Axolotlia.

The species are the Domestic Floopsan (Floopsanius Domesticus), Grent Floopsan (Floopsanius Floopsanius), and Mainland Floopsan (Floopsanius Major).

The word floopsan is from the Fentolese “Flok San”.

Domestic Floopsan

The domestic floopsan is a small rodent like mammal only 3-5 inches long that is round, playful, and very fluffy with a quite adorable face with big puppy dog eyes and very boopable snoots. It’s a pet found in many pet stores nationwide, they are usually dyed many different colors. Some companies will use toxic dyes that kill the floopsan young so that people buy more, despite it being highly illegal. Their natural color is white, or gray.

Some dark gray floopsans are bleached so that the dye works efficiently, despite bleaching being highly illegal and carries a massive fine.

It is advised to only buy floopsans from verified companies, so that the floopsans are treated humanely and legally.

They eat grass and fruits and veggies and leaves.

Grent Floopsan

Grent floopsen live on Grent Isle. They are tiny herbivores and very much not domesticated, being native to Grent Isle (the small island in the Grent Sea between Main Island and Bræ Island) they evolved to navigate the bush forest that covers the island, with only low to the ground bushes and no trees, only small animals can move around. They are the same size as domestic floopsans.

When a floopsan is released on any other island, it is free to wreak havoc and likely get obliterated by grets. It is illegal to release them on the mainland because of this, which counts as not only releasing an organism not for the environment, but also abusing the floopsan (domestic floopsen cant even survive the wild.)

They show insular dwarfism.

Mainland Floopsan

The Mainland Floopsan is a larger species of floopsan distinct from the Grent Floopsan, and the Domestic Floopsen derived from Grent Floopsans, they are roughly usually 5-8 inches long and are usually brown to gray in color, their fur is a bit more wiry and are more aggressive, they are ground dwellers and, unlike the Grent floopsan that evolved without any predators, have plenty to deal with, meaning they are more intelligent and are able to defend themselves. They do still share many traits with their Grent and domestic brothers.

They are at the base of the food chain and are preyed upon by most carnivores and omnivores on the islands, such as grets, þeran foxes, long leg crocs, and many others I haven't yet decided to add to the project.

Black Colonial Beaver

The black beaver is a beaver species only found in Axolotlia, they are communal, up to 50 lodges can be found in one dam lake, and their lakes can get large as the countless beavers all work together to maintain their dam.

They also defend it from predators together with their high intelligence.

If a colonial beaver dam fails it can unleash a large wave downstream. Their dams can spread many many yards and flood multiple acres.

The largest colony discovered has 273 beavers, their dam is 1.1 miles wide and has created a wetland around 3,200 acres in area on a minor tributary of the North Grent River.

Their wetlands are famously home to Axolotlian axolotls.

Wild Desert Robot Vacuum (Roomba)

In 2018, the Axolotlian Government released 1,217 solar-powered robot vacuums into the Arada Desert, it was an experiment by the government to have fun, and to see what happens. The vacuums had their vacuum elements removed and were fitted with strong motors and off road tires, they just brush sand around due to the lack of vacuuming. They are also actively maintained and tracked via GPS.

The public thought this was hilarious.

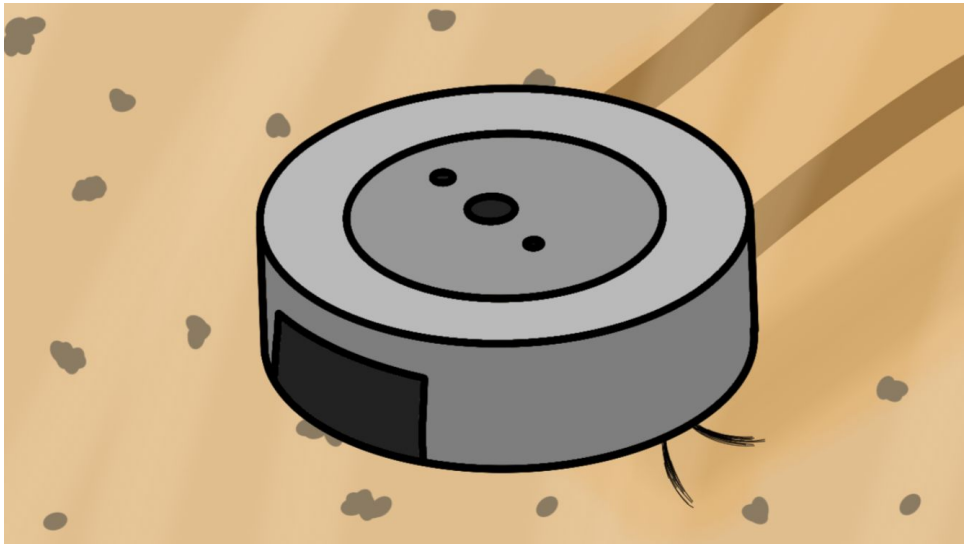
During the last check in 2023, there were 724 still-working vacuums, the furthest traveled one, #183 went 6.52 miles. Vacuum #633 had revealed a fossil.

Every now and then, people release new vacuums.

It is rumored that the vacuums are becoming a part of the ecosystem, as things for animals to ride.

Wild Desert Robot Vacuum picture

An artwork of one of the vacuums.



Aradan Sandswimmer

A smaller cousin species to the hilsk, it can burrow in the Arada desert’s sand very effectively, similar to the sandfish skink. They are carnivores and hunt by burrowing under its prey and then launching up to attack them. There's 3 subspecies, Sterklono, Flud, and Mountain.

They are small, only a few inches long and are much less playful than the hilsk, they aren't common pets but they can be bought at some pet stores.

Þeran Fox

The þeran fox is a fox species and main apex predator of Axolotlia. It lives almost anywhere but the Arada Desert and Bræ Island, it is the main counter to the gret, seeing how if the grets were in an environment without the þeran fox, they would wreak havoc. They also hunt the derox, and Werbrid.

They are a larger, black version of a fox that is surprisingly docile around humans, not good as pets but if you see one, take a selfie, they might even offer you to pet them.

They sometimes are solitary and sometimes hunt in packs, usually when hunting large prey like wooly cows.

It's name is from Fentolese “Tazaŕan” pronounced like “taharan”, meaning “fox”

Lady Evans’ Rolling Crab

The Rolling Crab is a crab like crustacean that curls itself into a ball and rolls around, propelling itself with its legs. Like a golden wheel spider, but propelled. It is named after Eleanor Evans, a British colonist explorer scientist going to Canada who stopped by Axolotlia to refuel on food and took 200 of the crabs to Canada to research them.

They have since become invasive because 4 had escaped her lab, Prince Edward Island was overrun in just 50 years, and they recently jumped across the water to Nova Scotia and New Brunswick as of 2019, Axolotlia gave Canada this advice “To kill them, set up traps in low lying areas, they mostly roll downhill, and struggle rolling uphill, if there's a lot in an area, traps in low areas like ditches work like a charm.”

Black Chipmunk

The black chipmunk (Tamias tenebris) is a species of chipmunk found in Axolotlia, Axolotlia has no squirrels, and the black chipmunk fills that role. They are small and basically just an ordinary chipmunk, but black, sometimes they have gray stripes.

They are super common in Axolotlia and are the base of the food chain above plants. They share the role with other species like the græ (gray) chipmunk, a similar species that is gray with some brown stripes, also found in Axolotlia.

There are 2 subspecies, one on the Mainland, and one on Bræ Island, the Bræ Island Black Chipmunk is actually dark gray with black stripes rather than black with gray stripes.

Sorginner

The sorginner is a very common songbird in Axolotlia, it's song is a long, melancholic “booo… ooh-ooh… wooo…” that is sung across the islands every morning from spring to fall.

It's name comes from the Axolisc word “sorgin” meaning sorrow, which comes from the Old English word “Sorgian”, meaning sorrow.

They are small and dark blue, about the size of a chickadee, they are very friendly and will even eat from your hand. They are hyperactive.

They hibernate in winter, they are omnivores.

Dogfish

The dogfish (houndfisc in Axolisc) is a fish species that fills a similar role to the Axolotlian axolotls, and were thought to be extinct hundreds of years ago, but they have recently made a comeback after evolving to become more competitive and are now a strong predator in most lakes and rivers across the country. They eat axolotls and fish and are an apex predator of Axolotlia’s water. Thankfully they will never make Axolotlian axolotls go extinct because the axolotls can go on land and in saltwater, both of which it cannot do.

They were nearly extinct and unseen for nearly a century before reappearing and now are prospering.

Pygmy Pelican

The pygmy pelican is a common species of pelican that is only about 1ft tall, and is a great case of Island Dwarfism. They eat usual pelican things but due to their tiny size can really only eat small fish, so dogfish and axolotls are off the menu for these guys.

They live mostly along the southern coast, and are common sight in Lucinia, and other cities and towns near the south.

Airhors

The airhors is a large predatory bird, it is a type of eagle that has evolved the unique ability to hover in place. Its wingspan is 6-8 feet. It has the ability to kill and lift large prey but often chooses to eat carrion instead, much like a vulture. It is mostly in the Arada desert but sometimes ventures into the Central Axolotlian Mountains, usually to nest among the treetops.

The airhorses on Presin Island, due to it being far from the mountains, instead nest on the rocky desert coasts of Presin Island.

It's main prey is the wild hilsks, although hilsks have evolved to effectively evade the airhorses.

Bobworm

The bobworm is a species of worm recently discovered by Maggie, President Dean's little sister, "it looks like a bobworm" she says. It was named because when it poops, it inexplicably traces the name "Bob".

It looks like an earthworm but a bit flatter and on average a little shorter, and with unusually large eyes for a worm.

There are no earthworms in Axolotlia, that role is filled by the bobworm.

Ants

Axolotlia has 2 native ant species, the white Axolotlian ant and the black Axolotlian ant.

Both ants build massive expansive colonies with multiple hubs. They also immediately begin huge wars with mile long frontlines upon contact with the other species

Fungi

Golden Grest Mushroom

Found in the eastern deserts, the golden Grest mushroom was discovered by Dr. Grest Powder. It is very very tasty, but it is horrible on pizza, due to its massive nasty flavor clash.

The golden Grest mushroom is usually found in groups of 1 to 3. Usually near cacti.

They are shiny gold in color.

Ghostshroom

Eating a Ghostshroom is intense. It’s the opposite sensation to a Ghost Pepper. Eating a Ghostshroom will cause the most intense brain-freeze imaginable. Most people blackout from the agonizing, freezing pain. But ingesting one can mitigate cancer symptoms, and give many other health benefits. It glows under a blacklight, and it makes your poops glow too!

When burned the smoke can be collected as a powder and after letting it cool, it is the drug called Ghostshroom Powder.

It's pale, almost neon green is not unmistakable for the slightly toxic, diarrhea inducing, Landerk Mushroom, also they often grow together, so carry a damn blacklight when scavenging for Ghostshrooms.

Semerþin Mushroom

The semerþin mushroom is a blue mushroom that glows in the dark. It is said to have magical properties in the native folklore, but that has been widely disproven. It is edible but tastes like pool noodles (not that I’ve trie pool noodles) and has no nutritional value. They are mostly used as decoration.

This image is a clipart of the semerþin mushroom, note the glow.

Neatishroom

The neatishroom is a small mushroom found in Axolotlian forest streams and ponds. It has evolved to look like a plant for some reason. Axolotlian axolotls eat these little shrooms when they have stomach aches. It helps coat the stomach lining like Pepto-Bismol. Pretty neat huh?

Axolotlian axolotls often eat them when sick, neatishrooms with bite marks are a good way to tell if a local axolotl population is sick.

Burnabusc Mold

The burnabusc mold is a mold that sucks tree sap. Most people that breathe it’s spores, will get headaches due to the chemicals.

It was put to a vote to eradicate it. Eradication failed. The vote was 44% to eradicate and 56% to tolerate.

It is called “burnabusc” because the easiest way to stop its spread is by burning it.

It is not invasive, because it is native to Axolotlia, but it is purely parasitic to the ecosystem and nobody would care if it went extinct, the ecosystem might even flourish.

Cuisine

Seasonal Foods

Do not exist.

Eggnog is sold year-round, as it should be everywhere, why must eggnog leave me every year. :(

Nimberberry Jam

Nimberberry Jam is made of nimberberries, check their slide for more. This orange jam is versatile and used in many Axolotlian dishes, here are but a few:

Toast, put on toast, simple. Sandwiches, also simple. Straight up, it's so good and healthy people eat it with a spoon. Bagels! Pastries, it is used as filling in many pastries from tarts to jelly donuts, and also baked into muffins and cakes. Those are only the most obvious uses, it can be used in anything other jams are used in.

Although one very Axolotlian use for it is to put it in The Axolotlian (smoothie).

Atlantic Cornbread

In Axolotlia, Atlantic Cornbread is used slightly more than wheat bread, including for things like sandwiches, and other bread related things. It is comparable to wheat bread in texture and flavor, though it is noticeably denser and like normal cornbread, a bit more crumbly, though it is sturdy enough to be used like normal wheat bread.

It is the main staple food of Axolotlia, if you don't count the corn it comes from. It is just an alternative to wheat bread and given it is native to Axolotlia, it is popular in Axolotlia. It has been eaten by natives for millennium and even colonists ate it over normal bread because it was easily grown in Axolotlia, and had been for so long thanks to the natives.

See Plants section for the slide on Atlantic Corn.

Roasted Werbrid / Werbridsteak

Often known as Werbridsteak, roasted Werbrid is a delicacy in Axolotlia, it is a traditional meal eaten by Axolotlians for centuries.

Werbridsteak is said to taste similar to turkey, but saltier, tougher, and more chewy.

Raw Werbrid meat can go for hundreds in countries far away from Axolotlia like in east and southeast asia. Why not use Australian Werbrid instead? Because Axolotlia has a better marketing strategy.

The Axolotlian (smoothie)

Made from huliaten, nimberberries, flunt pepper, and parelfruit, the Axolotlian is an Axolotlian classic, commonly drank by tourists on Axolotlia’s southern sandy shores.

If you make it improperly, the toxins in the parelfruit seeds could poison the drink and kill you.

That is why you need a license to make it.

If it’s blue, don’t drink it!

If it's green, the parelfruit was extra underripe.

If it’s purple, you were scammed, only huliaten in it.

Rhino Donut

The Rhino Donut is a spicy donut, made with jalapeños, and flunt peppers. It is a delicacy found in many Axolotlian donut shops.

Tourists often relax on Axolotlia’s southern sandy shore eating theses at seaside bars.

Derox Green Cheese

Derox Green Cheese is uniquely green. It has a very creamy consistency and a bitter taste. It is made from derox milk. It has also been used by natives for a long time as it is cheese, made from a local species.

Why did they not use the milk of the Bræ Wooly Cow? Because deroxes are everywhere, that's it.

The cheese is considered a staple food and is quite expensive outside of Axolotlia.

Corn Bread Stew

This is a staple food eaten in Axolotlia consistently from pre european times by the natives all the way till today with few changes, it is a very basic stew, it can be made fast and quickly. Usually with few ingredients.

It's recipe can vary wildly and there is no one single recipe, some call for meat, usually fish, while some don't, some put parelfruit juice into the broth, some don't, some add spices, some don't. But they all have corn bread that is often dunked in the broth and it is delicious.

It was eaten by colonists after the natives taught it to them because, its a basic stew made with what's available, and today it is a basic stew made with what's available. Nowadays it often is eaten for cultural reasons to connect to Axolotlia because people can buy foreign food cheaply, who would need to use native corn bread when you can buy white bread with extra sodium and added sugars for half the price.

Susæni Tea

Susæni tea is a tea made from susæni susæni, the vine that might at first seem impossible to make tea out of, given it is thick hard branches with no leaves to boil. To make it you chop vine into strips and boil those strips, the following tea is woody, and has a lot of fiber, more than most other tea. Unfortunately due to the rise in hot cocoa as Axolotlia’s morning drink replacing coffee or tea, Susæni Tea is falling out of favor, luckily, you can't kill Axolotlian culture and susæni tea is sold in many coffee shops nationwide, alongside coffee and hot cocoa.

Fish Chips

Fish chips are a classic snack found in Axolotlia, they are comparable to potato chips, and are slightly like jerky, they’re a little bit chewy. You can buy a bag of them in almost all stores in the country. They are a bit healthier than potato chips thanks to their protein content.

They are made out of many types of fish, such as cod, salmon, tropical, pre 1.13, I am very uncreative and cannot think of any fish species at the moment aside from Minecraft fish, just think of a fish and it probably has a fish chip variant.

They are actually a quite recent invention, having been first made in 1998.
